

Biodiversity informatics resources and databases on the internet

Karol Marhold

Biodiversity Informatics is the application of informatics techniques to biodiversity information for improved management, presentation, discovery, exploration and analysis.

It typically builds on a foundation of taxonomic, biogeographic, or ecological information stored in digital form, which, with the application of modern computer techniques, can yield new ways to view and analyse existing information, as well as predictive models for information that does not yet exist.

Wikipedia

Biodiversity Information Standards (TDWG)

We are a non-profit organization and community dedicated to developing biodiversity information standards

Historically known as the Taxonomic Databases Working Group, today's Biodiversity Information Standards (TDWG) is a not-for-profit, scientific and educational association formed to establish international collaboration among the creators, managers and users of biodiversity information and to promote the wider and more effective dissemination and sharing of knowledge about the world's heritage of biological organisms.

To achieve its goals, TDWG:

- develops, ratifies and promotes standards and guidelines for the recording and exchange of data about organisms;
- acts as a forum for discussing all aspects of biodiversity information management through meetings, online discussions, and publications.

See the [About](#) section to learn how TDWG operates and how you can participate. Active Interest Groups are described under [Community](#).

Darwin Core

Darwin Core is a standard maintained by the Darwin Core maintenance group. It includes a glossary of terms intended to facilitate the sharing of information about biological diversity by providing identifiers, labels, and definitions. Darwin Core is primarily based on taxa, their occurrence in nature as documented by observations, specimens, samples, and related information.

World Geographical Scheme for Recording Plant Distributions (WGSRPD)

WGSRPD provides an agreed system of geographical units at approximately "country" level and upwards for use in recording plant distributions. It allows adopting organizations to compare and exchange data with each other without loss of information due to incompatible geographical boundaries. The system offered covers the whole world and identifies units at four levels, firstly continental, secondly regional (or subcontinental), thirdly at what may be called "Botanical Country" level (which may often ignore purely political considerations), and fourthly at a slightly lower level called "Basic Recording Units" where political integrity is fully recognised.

Audubon Core

The Audubon Core (AC) is a set of vocabularies designed to represent metadata for biodiversity multimedia resources and collections. These vocabularies aim to represent information that will help to determine whether a particular resource or collection will be fit for some particular biodiversity science application before acquiring the media. Among others, the vocabularies address such concerns as the management of the media and collections, descriptions of their content, their taxonomic, geographic, and temporal coverage, and the appropriate ways to retrieve, attribute and reproduce them.

.. Taxonomic Literature II (TL-2)

Taxonomic Literature: A selective guide to botanical publications and collections with dates, commentaries and types (Stafleu et al.).

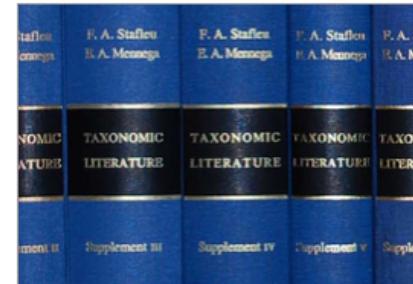

TL-2 is the premier publication of the International Association for Plant Taxonomy (IAPT) and this online version was made possible by the generous cooperation of the IAPT.

In its print form, TL-2 is a 15 volume guide to the literature of systematic botany published between 1753 and 1940. It is organized by author and includes numbered entries for the author's publications. Suggested abbreviations for use in taxonomic publications are provided: abbreviations for the author's name, short titles and abbreviations of the short titles for publications. TL-2 is the standard by which authors' names and titles should be abbreviated.

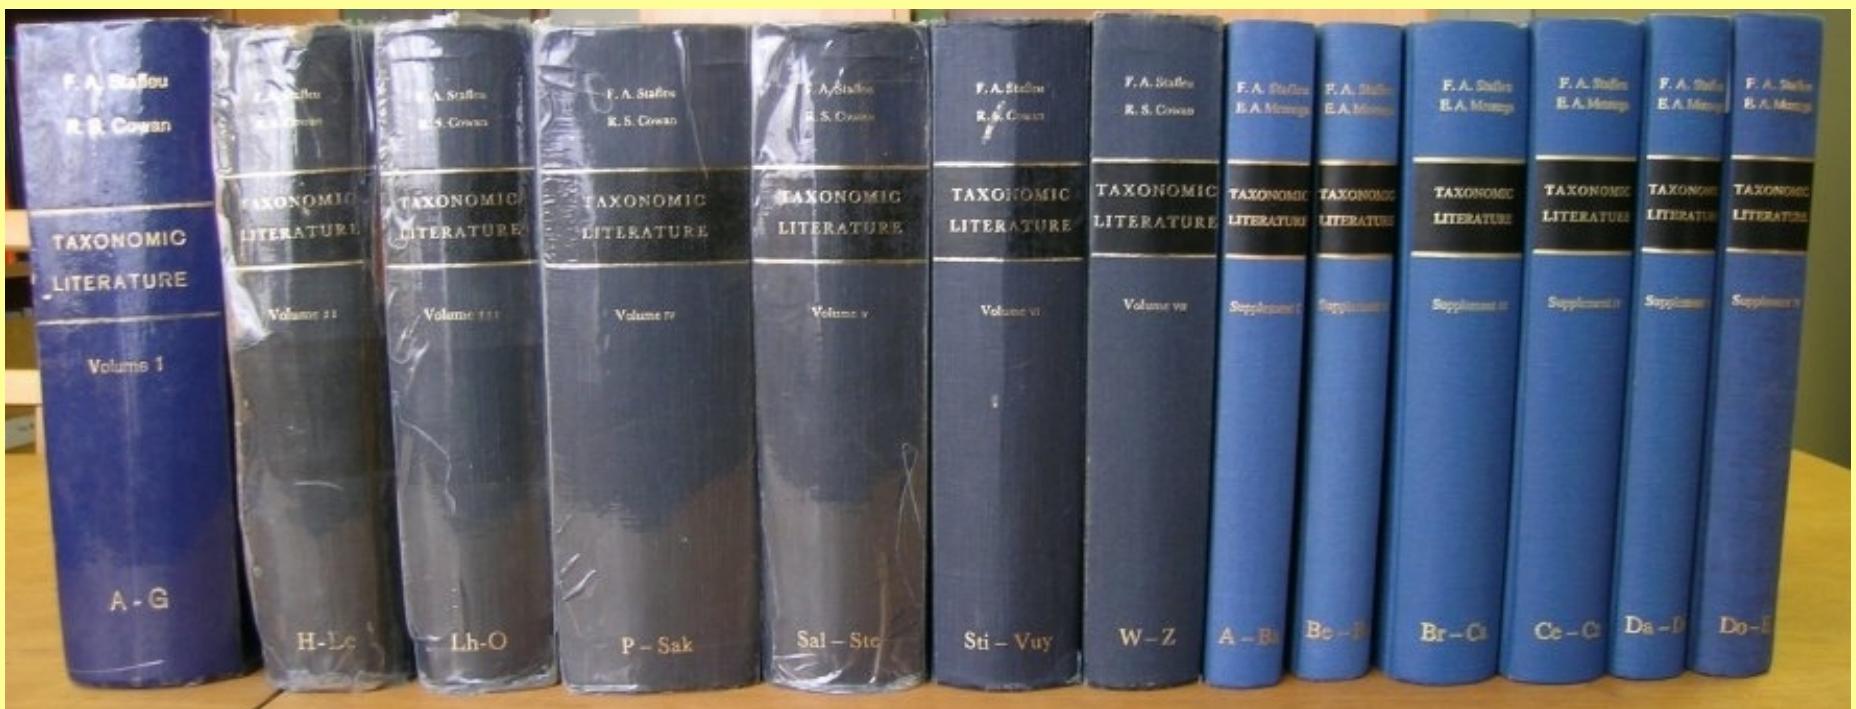

TL-2 at the Smithsonian Institution Libraries

Currently, we offer a basic database searchable by keyword, author name, title number, author name abbreviation, or title abbreviation. We display the search results with the scanned page and the parallel OCRed and corrected text in a "page turning" application.

The next round of planned improvements, to be done in conjunction with the redesign of the Smithsonian Libraries' website, is to implement Linked Open Data for the entire TL-2 dataset. This computer-friendly format will give each authors and publications a permanent, authoritative URI on the web. These URIs will contain information in both human-readable form (via HTML) and computer-readable form (via RDF/XML.) A SPARQL endpoint will also be provided for querying the linked data.

Further in the future, we wish to perform additional parsing of the data to, for example, extract the Herbaria that contain specimens collected by the authors, link authors and publications to other sources on the web such as the [Virtual International Authority File](#), the [Biodiversity Heritage Library](#), and the

Koch, Wilhelm Daniel Joseph (1771-1849), German physician and botanist; Dr. med. Giessen 1794; practiced at Kaiserslautern from 1797 until 1824, then professor of botany at Erlangen. (*W. Koch*).

HERBARIUM and TYPES: The type herbarium of the *Synopsis* was acquired by Suringar and is now at L. The non-German part of the herbarium is at ER. Other material at G.

Harvard University Herbaria & Libraries

Digital Collections

Specimens

Staff are working to create digital records of the over 5 million specimens in the Harvard University Herbaria to include in the Index of Botanical Specimens Specify 6 database. Approximately 100,000 specimens correspond to type specimens of vascular plants and mosses. Also included are fungi, lichens, bryophytes, and algae.

Botanists

The Botanist Database contains authors of botanical names, collectors of botanical specimens, and authors of botanical publications.

Index of Botanists

Index of Botanists

Authors of plant names, botanical and mycological collectors, and authors of publications of importance to systematic botany and mycology, are combined into a single resource. To search: enter the person's name either as *lastname, firstname*, e.g. *jones, david* or by the standard abbreviation, e.g. *d r jones*. The name of an author or collector sometimes consists of multiple names and can be entered as such. Team records can be located by searching for the name of any of its members. Check the **Team** box when searching for a team. Checking the botanist's role (Authors, Collectors, Individuals, Teams) will constrain the search further, otherwise all records in the database that satisfy the search criteria will be matched. Herbaria in which material is known to have been deposited by a botanist can be searched in **Remarks**. Place names and taxon names sporadically occur within **Remarks**.

Index Nominum Genericorum (ING)

A compilation of generic names published for organisms covered by the *International Code of Botanical Nomenclature*.

[Introduction](#)

[Help File](#)

[ING Collaborators](#)

[Contact Us](#)

[Suggested Citation](#)

[\[Return to Search\]](#)

The Index Nominum Genericorum (ING), a collaborative project of the International Association for Plant Taxonomy (IAPT) and the Smithsonian Institution, was initiated in 1954 as a compilation of generic names published for all organisms covered by the International Code of Botanical Nomenclature. We are pleased to offer a way to search the ING database. We hope that those needing access to information about generic names of plants will use the index and will advise us of potential additions and corrections.

Ellen Farr and Gea Zijlstra, Editors

Introduction

The original intent of the ING was to bring all generic names of plants together in a single list to reveal homonymy between groups. In addition, ING includes bibliographic citations and information about the typification and nomenclatural status of generic names. The index was first published on sets of printed cards and then in book form in 1979 (Farr et al., 1979). A supplement was also published (Farr et al., 1986). While a second supplement is planned, we recognize that hard copy is immediately out of date, and for users with access to the Internet we believe that the World Wide Web offers promise as a useful platform for a collaborative project such as this. Current work on the ING is supported by the Smithsonian Institution, IAPT, and the University of Utrecht, Utrecht, The Netherlands. The content of the database was developed over a 40-year period by the efforts of more than 100 [collaborators](#). A number in parentheses identifying the collaborator appears at the end of each entry. We hope that the community of users will continue to contribute additions and corrections to the index.

Limitations

This electronic version must be considered a draft edition. The database is

Search for a generic name in ING, Index Nominum Algarum, TROPICOS, and Index Fungorum. Results are displayed on a single page. Report problems to [Ellen Farr](#). [updated 24 Jan 2013]

Enter a Generic Name:

OR LIMIT SEARCH TO THE ING DATABASE.

Enter a word or phrase:

SELECT THE FIELD TO SEARCH:

[A maximum of 300 records will be returned.]

- Generic Name. All records with the name in the 'genus' or 'synonym' field will be displayed. The wild card character, *, may be used (e.g., Asteranth* or *aster).
- Name/Basionym for Type. Enter a species combination to see if it provides the type of a generic name. Enter a generic name to see all entries in which the type is cited by a combination in that generic name.
- Author. The 'Help File' (see menu at left) has information on entering diacritical marks.
- Family. See the 'Help File' (on menu at left) for limitations.

The Plant List

A working list of all plant species

[Home](#) [About](#) [Browse](#) [Statistics](#) [Feedback](#) [How to use this site](#)

The Plant List (TPL) was a working list of all known plant species produced by the botanical community in response to Target 1 of the 2002-2010 Global Strategy for Plant Conservation (GSPC). TPL has been static since 2013, but was used as the starting point for the Taxonomic Backbone of the *World Flora Online* (WFO), and updated information can be found at www.worldfloraonline.org.

WFO is being developed by a consortium of leading botanical institutions worldwide in response to the 2011-2020 GSPC's updated Target 1: to achieve an online Flora of all known plants by 2020. WFO welcomes feedback from users for improvements to its Taxonomic Backbone which is curated by a growing community of WFO Taxonomic Expert Networks (TENs).

The Plant List is a working list of all known plant species. It aims to be comprehensive for species of Vascular plant (flowering plants, conifers, ferns and their allies) and of *Bryophytes* (mosses and liverworts).

Collaboration between the Royal Botanic Gardens, Kew and Missouri Botanical Garden enabled the creation of The Plant List by combining multiple checklist data sets held by these institutions and other [collaborators](#).

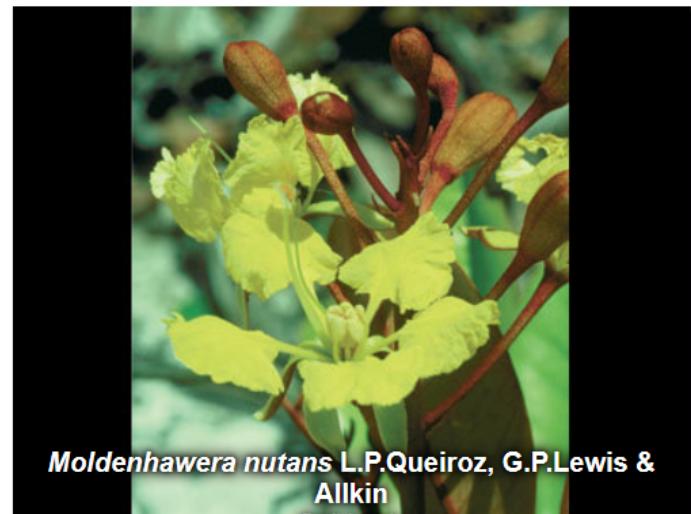

Version 1.1 (September 2013) replaces Version 1.0 which [remains accessible here](#). Version 1.1 includes new data sets, updated versions of the original data sets and improved algorithms to resolve logical conflicts between those data sets.

LCVP, The Leipzig catalogue of vascular plants, a new taxonomic reference list for all known vascular plants

Martin Freiberg , Marten Winter, Alessandro Gentile, Alexander Zizka, Alexandra Nora Muellner-Riehl, Alexandra Weigelt & Christian Wirth

Scientific Data 7, Article number: 416 (2020) | [Cite this article](#)

10k Accesses | 11 Citations | 206 Altmetric | [Metrics](#)

Abstract

The lack of comprehensive and standardized taxonomic reference information is an impediment for robust plant research, e.g. in systematics, biogeography or macroecology. Here we provide an updated and much improved reference list of 1,315,562 scientific names for all described vascular plant species globally. The Leipzig Catalogue of Vascular Plants (LCVP; version 1.0.3) contains 351,180 accepted species names (plus 6,160 natural hybrids), within 13,460 genera, 564 families and 84 orders. The LCVP a) contains more information on the taxonomic status of global plant names than any other similar resource, and b) significantly improves the reliability of our knowledge by e.g. resolving the taxonomic status of ~181,000 names compared to The Plant List.

Euro+Med PlantBase - Preview of the new data portal

Euro+Med Plantbase covers all native and introduced vascular plants from Europe, the Mediterranean and the Caucasus. At present, hybrids and taxa below the rank of subspecies are not treated.

Euro+Med PlantBase integrates and critically evaluates information from *Flora Europaea*, *Med-Checklist*, *Flora of Macaronesia* and from regional and national floras and checklists as well as additional taxonomic and floristic literature. This is complemented by the European and Mediterranean taxa of several families taken from the World Checklist of Selected Plant Families ([WCSP](#)) and of the *Leguminosae* from the International Legume Database and Information Service ([ILDIS](#)). Euro+Med PlantBase is continuously updated by an international network of taxonomic and regional editors and advisers, coordinated by the Euro+Med PlantBase Secretariat at the Botanic Garden Berlin.

Euro+Med PlantBase is now accessible via a new data portal, which is still partly under development. The new portal makes full use of the [EDIT Platform for Cybertaxonomy](#) and all data have been migrated from the old system to the new. One of the most important features of the new portal is that corrections and additions to the database, e.g. new taxa and new area records, are immediately visible on the taxon pages.

The new data portal is not yet in its final version and there are still a number of known issues that have to be solved. However, because updating of the old database has been discontinued, the Euro+Med PlantBase Secretariat has decided to put the new portal online for review and information access.

Feedback

Please send any comments, suggestions for improvement, corrections etc. to the Euro+Med Secretariat, Berlin, BGMB:

World Checklist of Selected Plant Families (WCSP)

Quick Search

<https://wcsp.science.kew.org/>

Search for a family, genus, or genus plus species

Find name

Enter family names in full and use the wildcard character (*) for partial matches on genus and species.

WCSP is an international collaborative programme ([view contributors](#)) that provides the latest peer reviewed ([view reviewers](#)) and published opinions on the accepted scientific names and synonyms of selected plant families. It allows you to search for all the scientific names of a particular plant, or the areas of the world in which it grows (distribution).

The checklist includes 200 Seed Plant families ([View list of included families](#)). Different families are in different stages of review as indicated in the family list. There are currently more than 155 contributors from 22 countries.

To perform a more detailed search go to the [Advanced Search Page](#).

The screenshot shows the homepage of the Global Biodiversity Information Facility (GBIF) at <https://www.gbif.org>. The page features a large background image of a mosquito on human skin. At the top, there's a navigation bar with links for 'Get data', 'How-to', 'Tools', 'Community', and 'About'. On the right side of the header are various icons for user authentication and site management. Below the header, the text 'GBIF | Global Biodiversity Information Facility' is displayed, followed by the slogan 'Free and open access to biodiversity data'. A search bar with the placeholder 'Search' is centered below the slogan. The main menu includes 'OCCURRENCES', 'SPECIES', 'DATASETS', 'PUBLISHERS', and 'RESOURCES'. A secondary menu bar at the bottom of the header includes 'What is GBIF?' and 'About GBIF Czechia'. The footer section contains four data statistics with corresponding icons: 2,246,468,528 Occurrence records, 79,025 Datasets, 1,926 Publishing institutions, and 7,894 Peer-reviewed papers using data.

A network of primary biodiversity repositories

The Biological Collection Access Service (BioCASE) is a transnational network of primary biodiversity repositories. It links together specimen data from natural history collections, botanical/zoo gardens and research institutions worldwide with information from huge observation databases.

The aim is to make the world's data on biodiversity freely and universally accessible on the Internet through data portals and web services, a goal that BioCASE shares with related initiatives such as the [Global Biodiversity Information Facility \(GBIF\)](#) and [Integrated Digitized Biocollections \(iDigBio\)](#) .

In the past years, BioCASE has developed into a widely accepted standard for data sharing and has laid the foundations for several thematically - both taxonomically and geographically - specialized networks (see box to the right). [Read more](#)

The [BioCASE secretariat](#) is based at the [Botanic Garden and Botanical Museum Berlin](#) and will be happy to answer any questions regarding BioCASE.

BioCASE is the GBIF Participant Node for the [Consortium of European Taxonomic Facilities](#) .

non vidi.

2. f. **grandiflora** O. E. Schulz.

Petala 4—11 mm longa.

Hab. hic illic, praesertim in Rossia.3. f. **parviflora** O. E. Schulz.

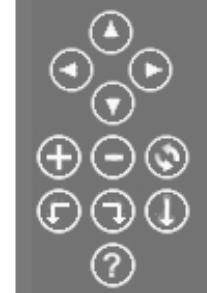

Petala 4—5 mm longa, saepe staminibus breviora.

C. borealis Laest. ? apud Nyman Conspect. 37 (1879), pro specie.

Crescit praecipue in Rossia et montibus altissimis.

○○ Ovarium c. 12-ovulatum. Antherae flavae.
Caulis non nitens.76. **C. Schinziana** O. E. Schulz.

Caulis 35—40 cm altus, erectus, simplex, subdense 12—15-folius, glaberrimus, ut tota planta. Folia omnia subaequalia, subminuta, caulina inferiora 4—7,5 cm longa, breviter (= 1,5 fol.) petiolata, 5-juga: foliolum terminale obovato-cuneatum, antice 3—5-crenatum, brevissime petiolulatum. 11 mm longum, 7,5 mm latum, lateralia sessilia, sensim minora, superiora anguste obovata, latere inferiore 1-crenata, inferiora valde alterna, integra; caulina superiora 2—3,5 cm longa, brevissime petiolata, 4—3—2-juga: foliola magis incisa, terminale anguste obovato-cuneatum, utrinque subinaequaliter profunde 2—3-crenato-serratum, 4 : 6 mm, lateralia latere superiore 1-, rarius 2-, inferiore profundius 1—2-lobulata; caulina summa minuta, 2—1-juga: foliola fere linearia, vix crenato-serrata. Racemus sub anthesi laxiusculus, subnutans, pauci- (c. 10-) floros. Pedicelli floriferi tenues, 9—14 mm longi. Flores 6—7 mm longi. Sepala ovata, acutiuscula, 2,5 mm longa. Petala alba, obovato-cuneata. Stamina interiora 4, exteriora 3,5 mm longa: antherae 0,75 mm longae, oblongiusculae, in siccо flavae. Ovarium c. 12-ovulatum, in stylum subulatum, 1 mm longum

Book contributed by [Missouri Botanical Garden](#)

Inspiring discovery through free access to biodiversity knowledge.

The Biodiversity Heritage Library improves research methodology by collaboratively making biodiversity literature openly available to the world as part of a global biodiversity community.

BHL also serves as the foundational literature component of the Encyclopedia of Life ([EOL](#)).

Index to Plant Chromosome Numbers (IPCN)

The **Index to Plant Chromosome Numbers** is an **NSF funded project** that aims to extract and index original plant chromosome numbers of naturally occurring and cultivated plants published throughout the world. A committee of voluntary contributing editors, located in various parts of the world, reviews sets of serial titles assigned to them and returns the information to the editors for collation in the *Index* and database. Chromosome indexes are published at two or three year intervals. The *Index to Plant Chromosome Numbers* project has been based at the Missouri Botanical Garden since 1978. Data from published indexes from 1979 onward are available for consultation through this facility.

For additional information, see the last supplement by Goldblatt & Johnson 2006. *Index to Plant Chromosome Numbers 2001-2003. Monographs in Systematic Botany from the Missouri Botanical Garden* 106.

An Index covering the years 2004-2006 is in preparation and will be published in the fall of 2008 as: Goldblatt & Johnson 2008. *Index to Plant Chromosome Numbers 2004-2006. Monographs in Systematic Botany from the Missouri Botanical Garden*.

Many but not all data in the printed version of the *Index to Plant Chromosome Numbers* (1979--) are available on the Web in the IPCN database. The printed indexes and the database provide references to chromosome counts reported in the original literature. We therefore request that the IPCN database itself not be cited as the source for chromosome counts. If there is a need to cite the IPCN database, we recommend the following:

Index to plant chromosome numbers. 1979-- . P. Goldblatt & D. E. Johnson, eds. Missouri Botanical Garden, St. Louis.

The ***Chromosome Counts Database (CCDB, version***

1.58) is a comprehensive community resource for plant chromosome numbers.

CCDB aims to combine existing data **resources** into an extensive central database that will be updated regularly by the community.

Users and researchers are encouraged to contribute to the accuracy and completeness of the data in CCDB by **submitting new counts**, or **reporting erroneous counts**.

To start browsing for chromosome numbers, use the **Browse** page, or the search box above.

Chromosome numbers for the Italian flora

G. Bedini, L. Peruzzi (eds.)

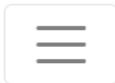

Biology Department, University of Pisa
via Luca Ghini 13, I-56126 Pisa, Italy

Chrobase.it stores chromosome counts mainly for the Italian flora. Also counts from Corsica are being included, given the high number of endemics shared with Sardinia and Tuscan Archipelago. Current holdings are (live from database as of today, Monday 18 October 2021, 12:02:24 UTC):
