

HydroPredict, Vienna, September 2012

Special Session 3: Choosing Models for Resilient Water Resources Management  
Water Partnership Program (WPP)/TWIWA- The World Bank

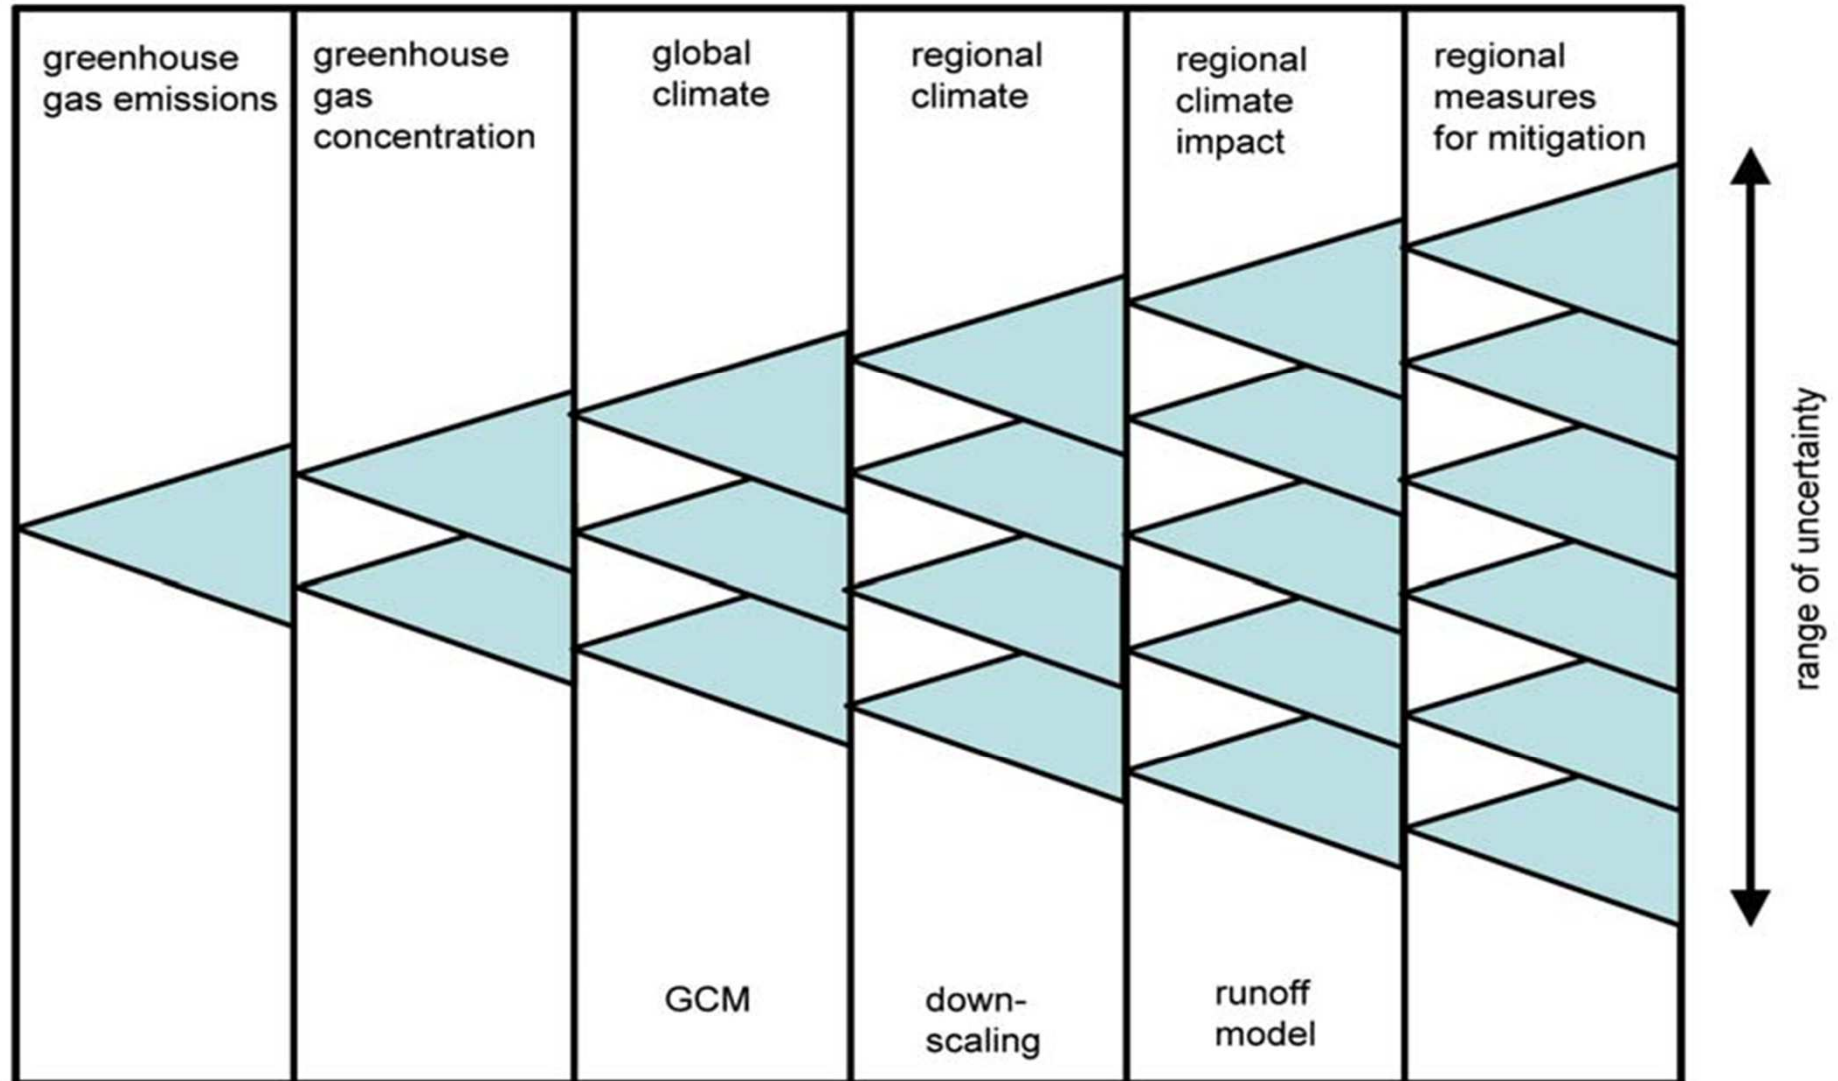

# Risk Informed Decision Making in a Changing Climate

Rolf Olsen, PhD, Kristin Gilroy, PhD,  
Guillermo Mendoza, PhD, Casey Brown, PhD,  
Kevin Mulligan and Scott Steinschneider

# Outline

- Why a risk-informed decision making approach?
- Risk-informed decision making framework introduction
- Application to U.S. Army Corps of Engineers reservoir in Iowa, USA
- Next steps – Work with Alliance for Global Water Adaptation (AGWA)

# Uncertainty in Climate Change Impact Analysis

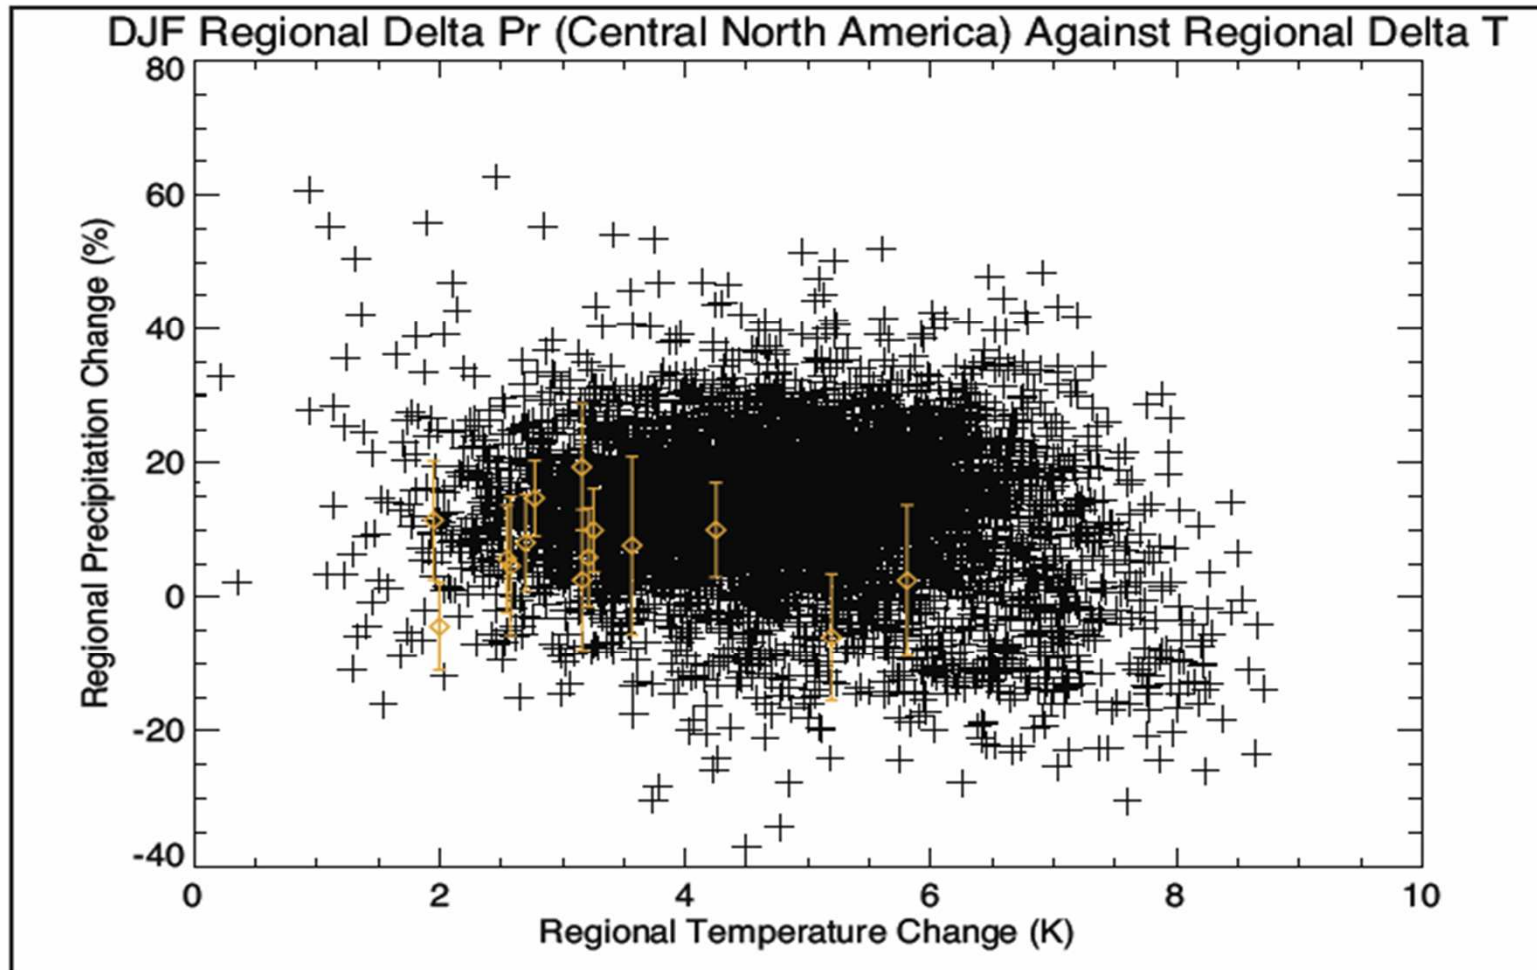

HydroPredict, Vienna, September 2012

Special Session 3: Choosing Models for Resilient Water Resources Management

Water Partnership Program (WPP)/TWIWA- The World Bank

# Climate Model Uncertainty

HydroPredict, Vienna, September 2012

Special Session 3: Choosing Models for Resilient Water Resources Management

Water Partnership Program (WPP)/TWIWA- The World Bank

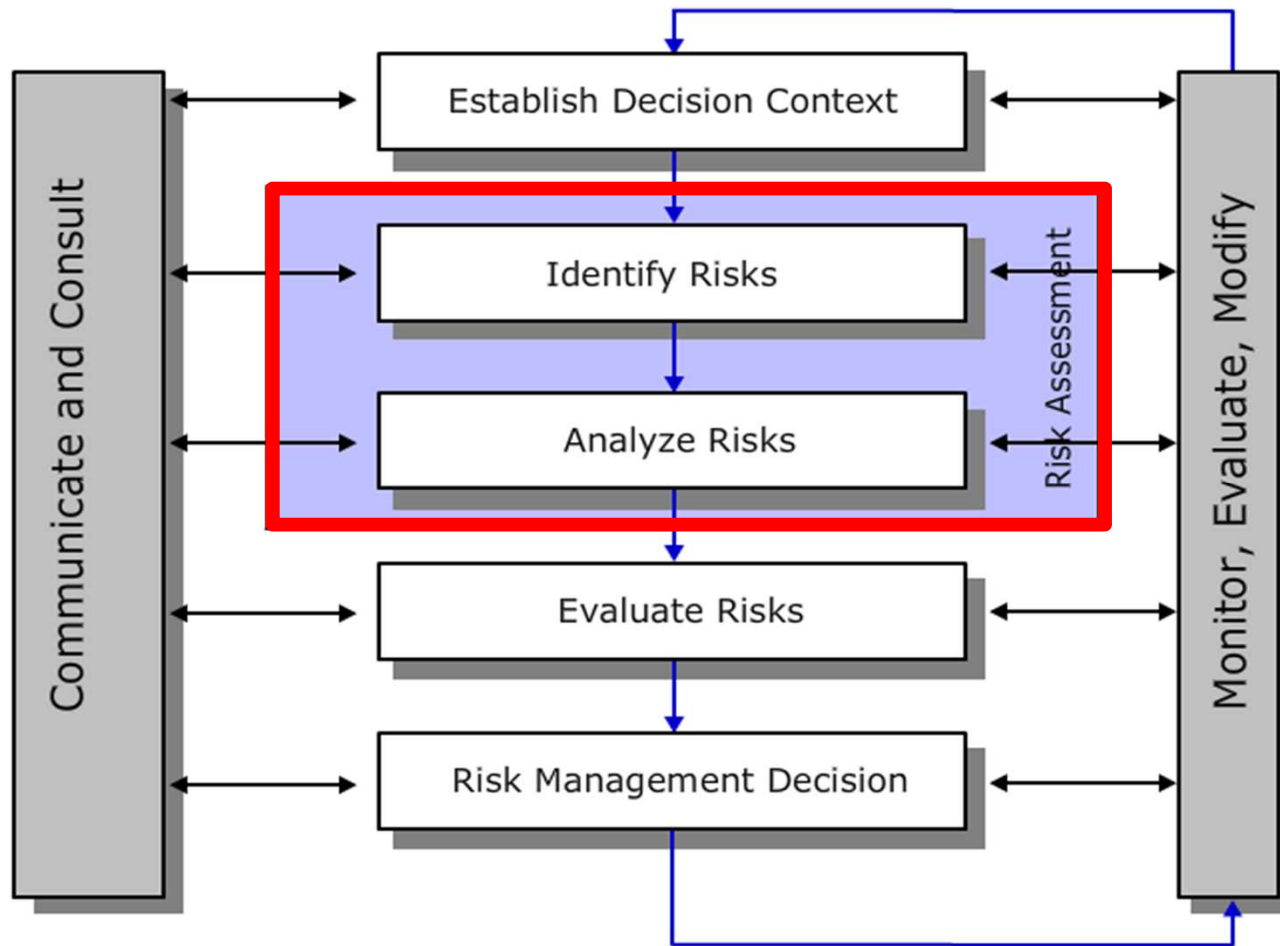

# Probability Assessment

- Probability assessment has been based on observed record and assumption that the statistical properties of hydrologic variables in future time periods will be similar to past time periods.
- Climate change challenges this assumption.
- Use of climate model for future probabilities is likewise problematic.
- An ensemble of climate models is not a representative sample of future climate.

# Problem Statement

- Future climate is uncertain: Recent past may not be representative of future climate, but climate projections are uncertain.
- Probability distribution of future climate is uncertain making traditional cost benefit more doubtful.
- Climate projections represent only a fraction of possible future climate.
- How do we make investment decisions given this uncertainty?

# Risk Informed Decision Making Framework

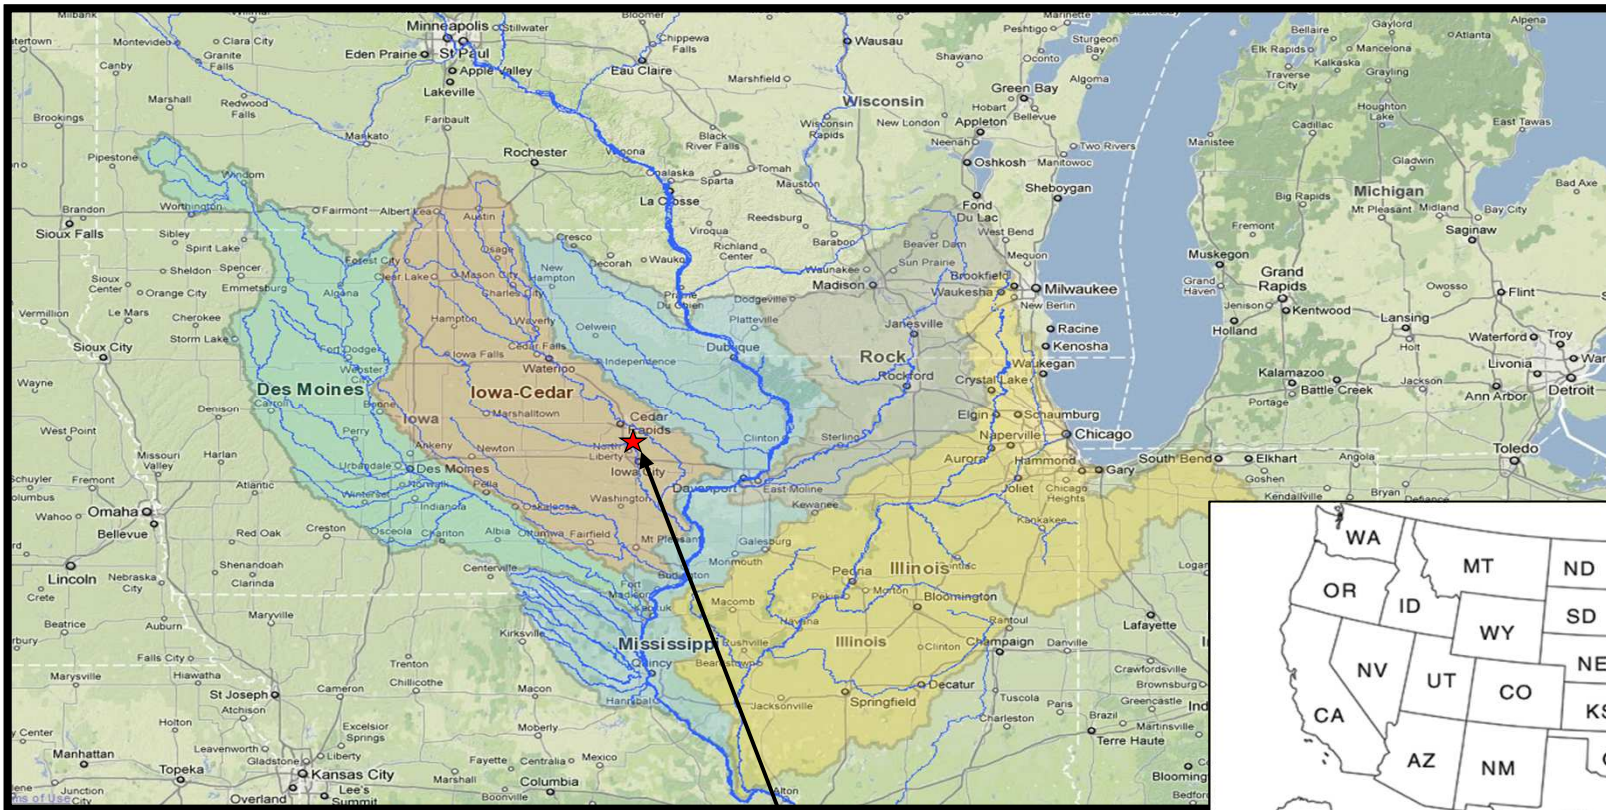

# Identify Risk

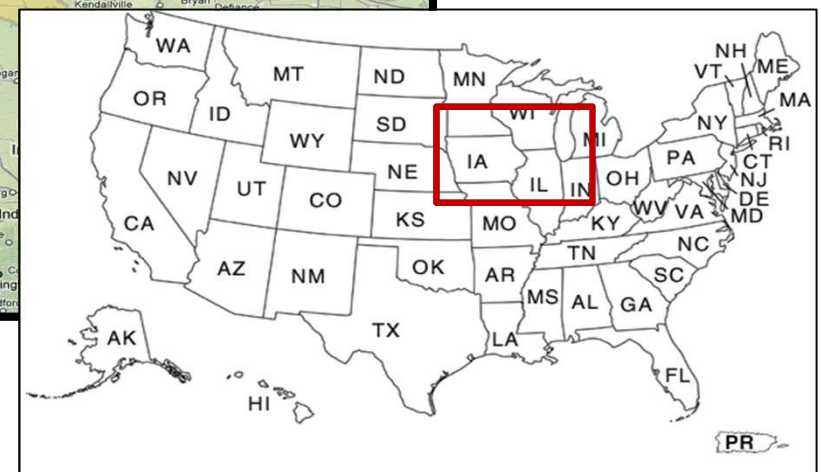

- Identifying risks of loss or potential gain associated with decision context is beginning of what is commonly known as “risk assessment.”
  - Look for the Hazard or Opportunity
  - Consequence Assessment
  - Likelihood Assessment
  - Risk Characterization
- Risk = (Consequence) and (Likelihood)**

# Example: Coralville Flood Risk Management Analysis

Coralville Lake

HydroPredict, Vienna, September 2012

Special Session 3: Choosing Models for Resilient Water Resources Management

Water Partnership Program (WPP)/TWIWA- The World Bank

# Coralville Lake 15-Day Peak Inflow

HydroPredict, Vienna, September 2012

Special Session 3: Choosing Models for Resilient Water Resources Management

Water Partnership Program (WPP)/TWIWA- The World Bank

# Risk Assessment Part I: Identify Risks

- Identify critical zones through stakeholder involvement
- Conduct stress test of system under various climate states

# Stress Tests

- **Goal**

To identify system breaking points under various climate states

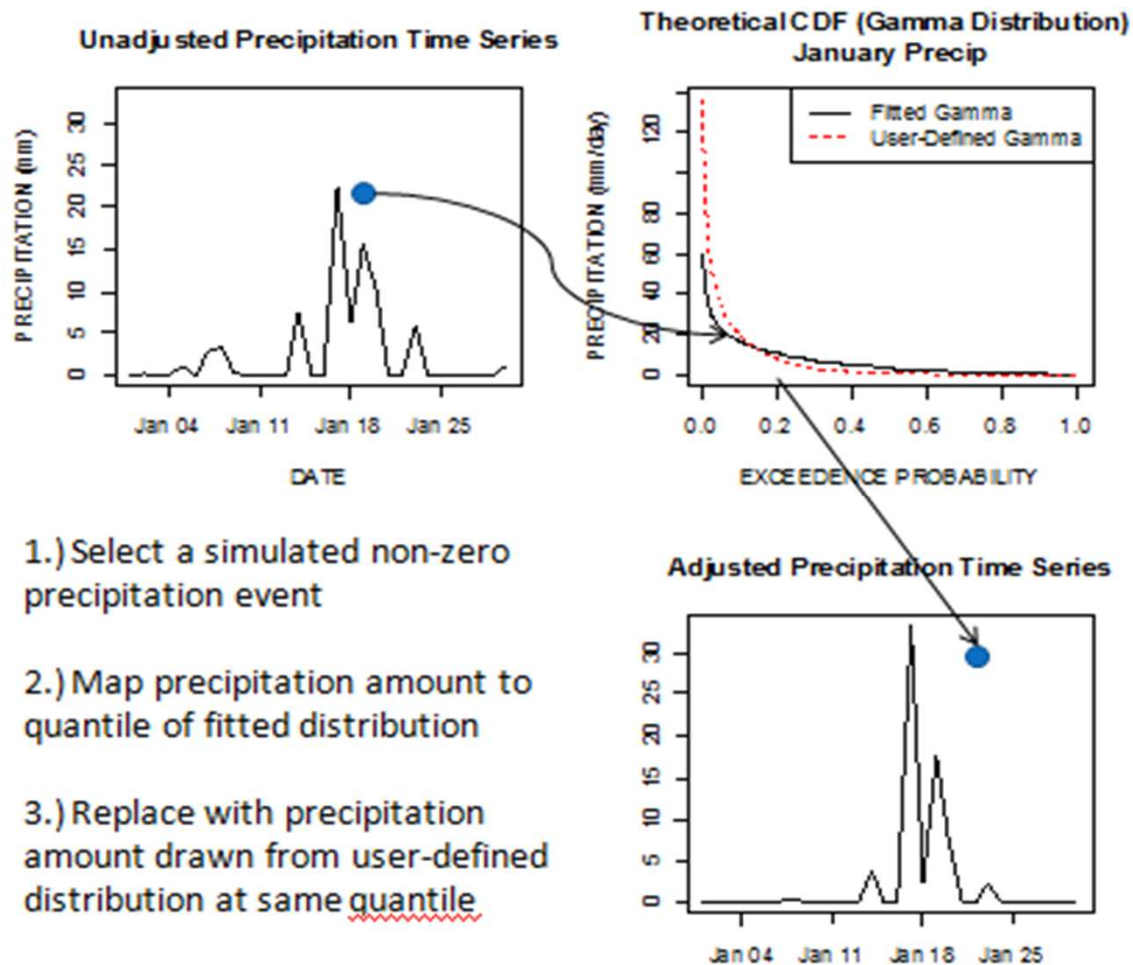

- **Metrics Assessed**

- Flood Management: Return Period, Expected Annual Damages
- Water Supply: Firm Yield, Reliability, Cost

- **Approach**

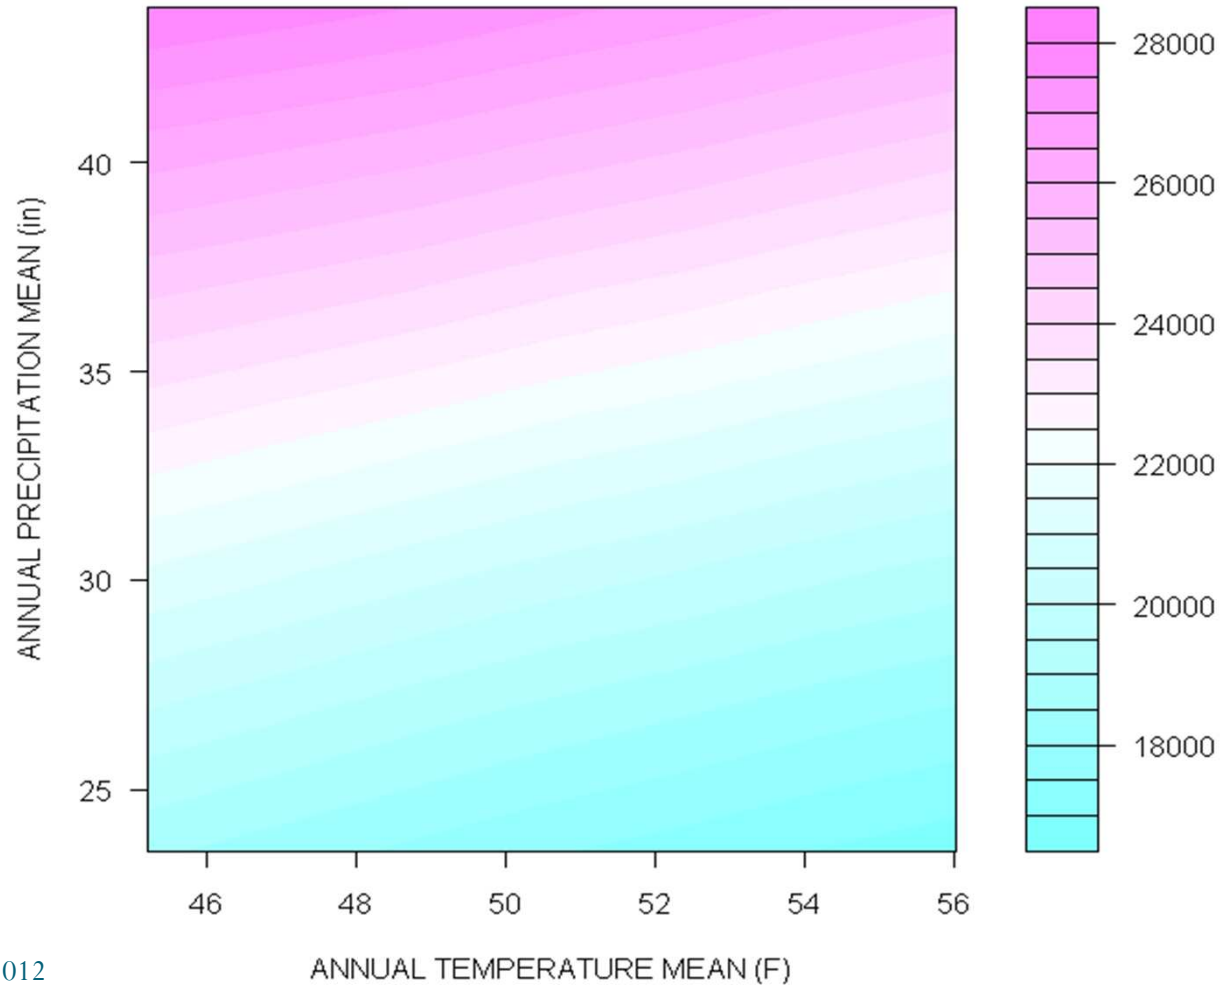

Use weather generator to stochastically model rainfall occurrence, amount, and other climate fields

# Climate Stress Test: Prescribed Climate Changes

# Stress Test: 100-yr Event for 15-Day Peak Flow

**CLIMATE RESPONSE OF 100-YEAR EVENT  
FOR 15-DAY PEAK FLOW (CFS)**

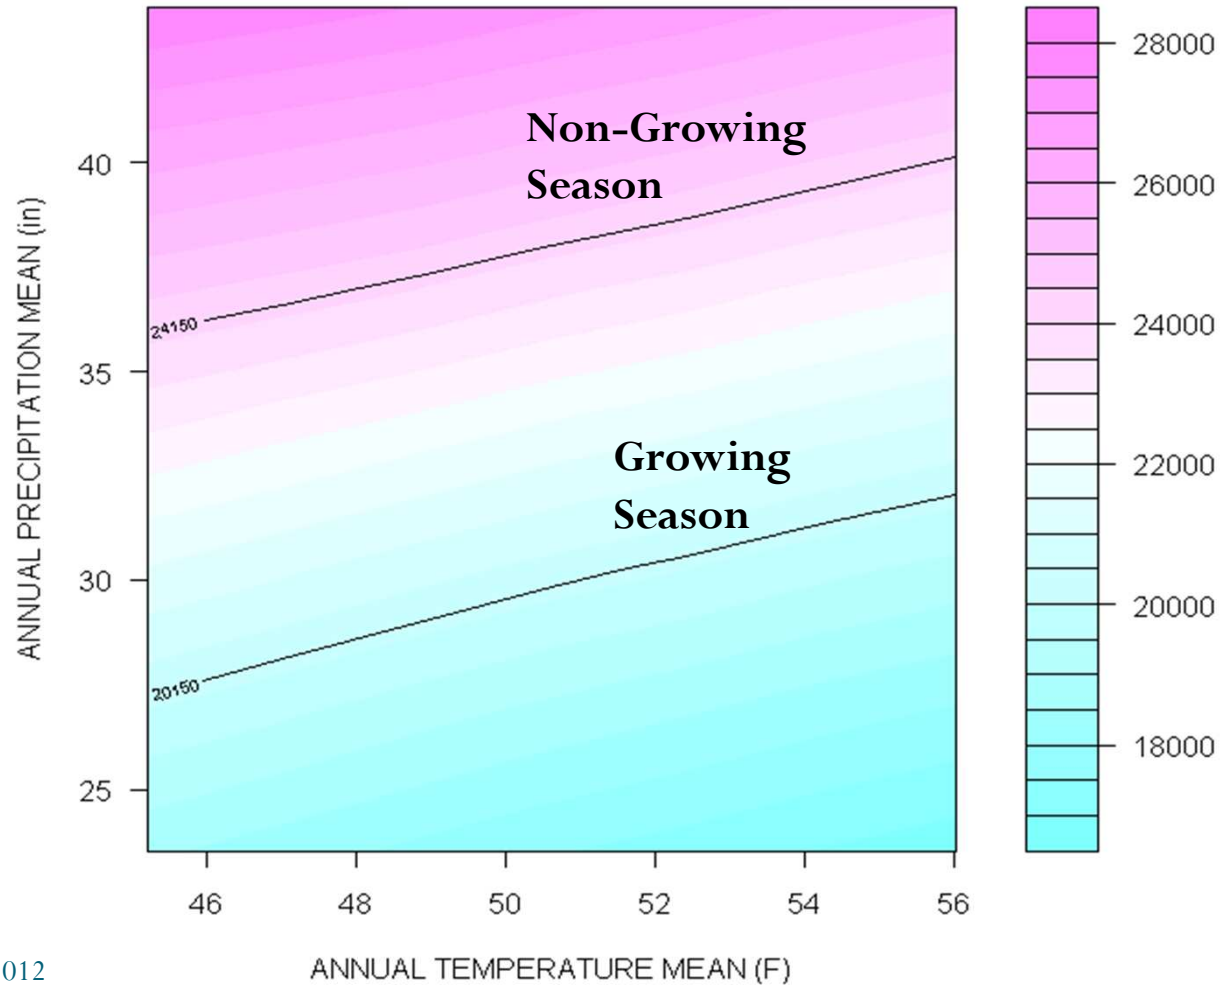

HydroPredict, Vienna, September 2012

Special Session 3: Choosing Models for Resilient Water Resources Management

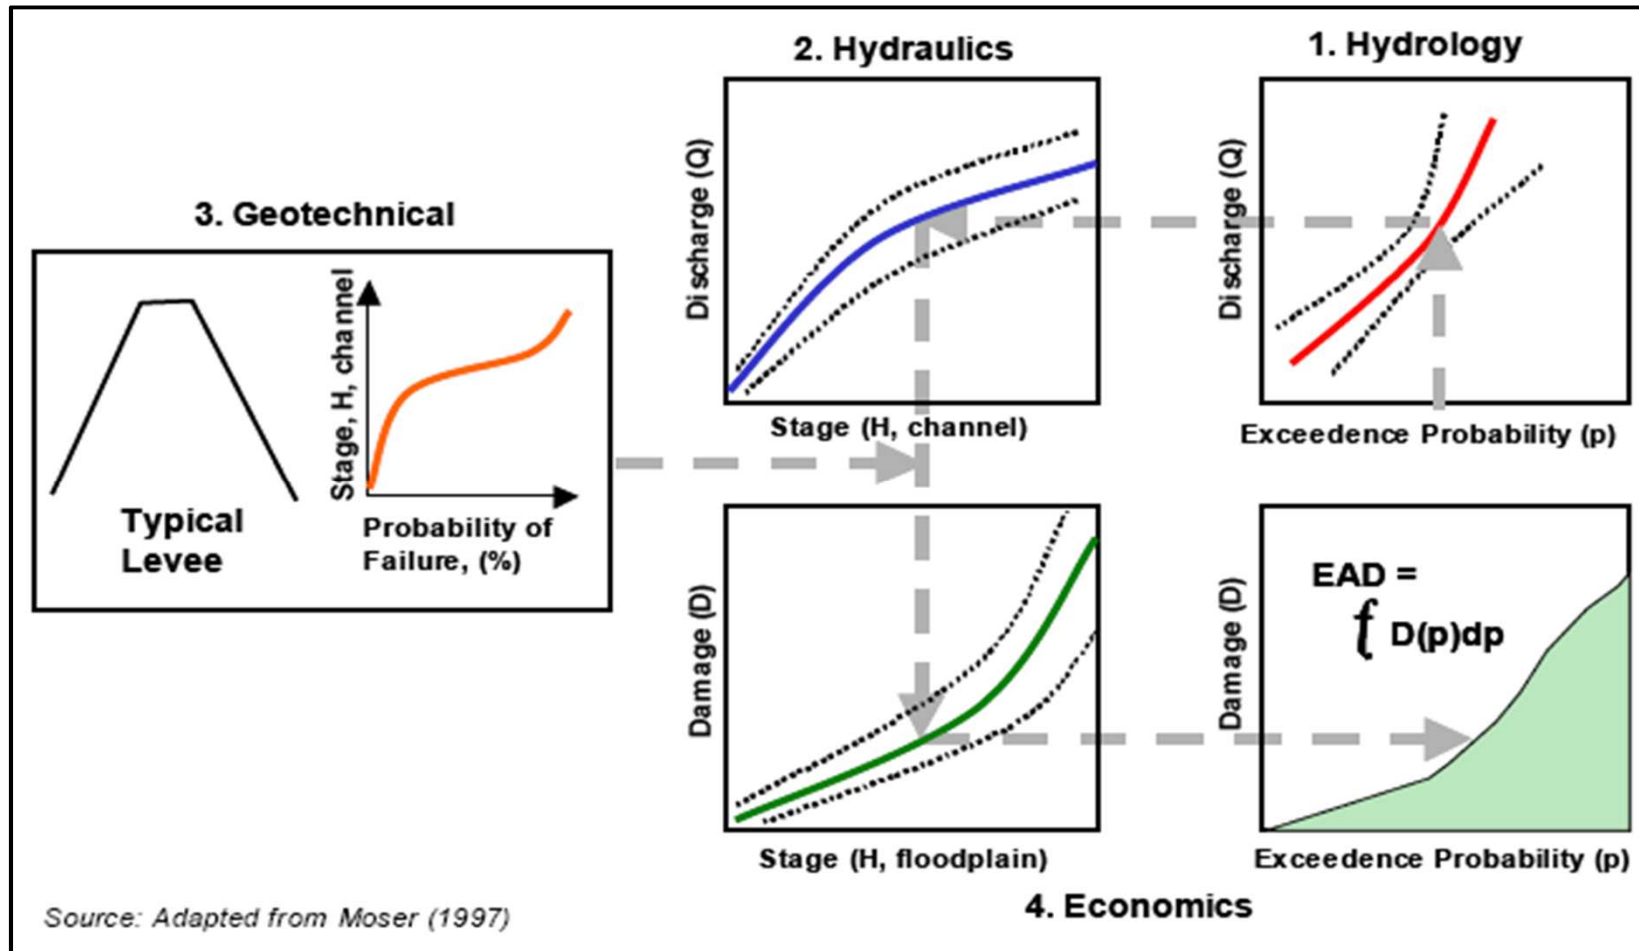

Water Partnership Program (WPP)/TWIWA- The World Bank

# Stress Test: 100-yr Event for 15-Day Peak Flow

CLIMATE RESPONSE OF 100-YEAR EVENT  
FOR 15-DAY PEAK FLOW (CFS)

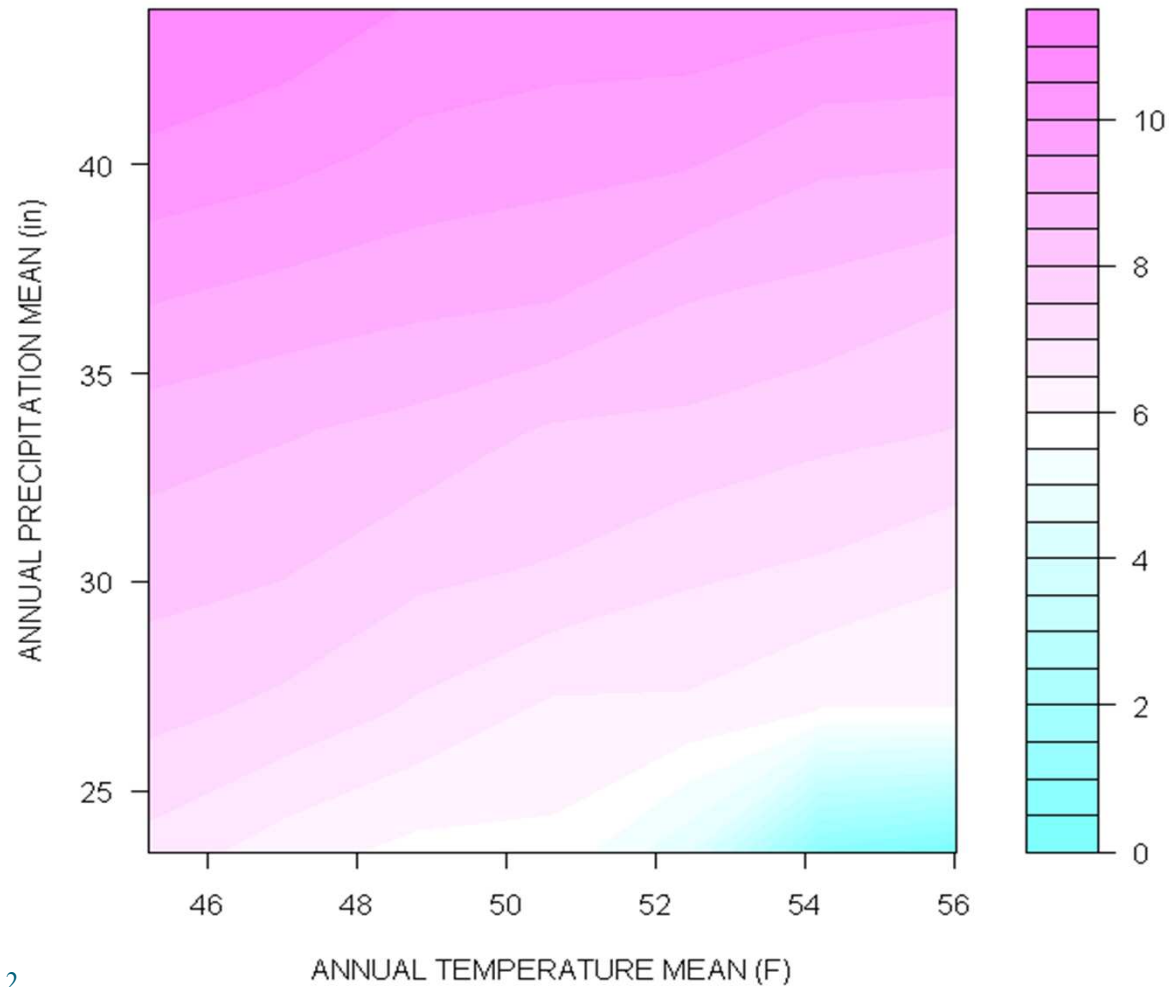

# Stress Test: Expected Annual Damages

# Stress Test: Expected Annual Damages

**EXPECTED ANNUAL FLOOD DAMAGES  
(\$, MILLIONS)**

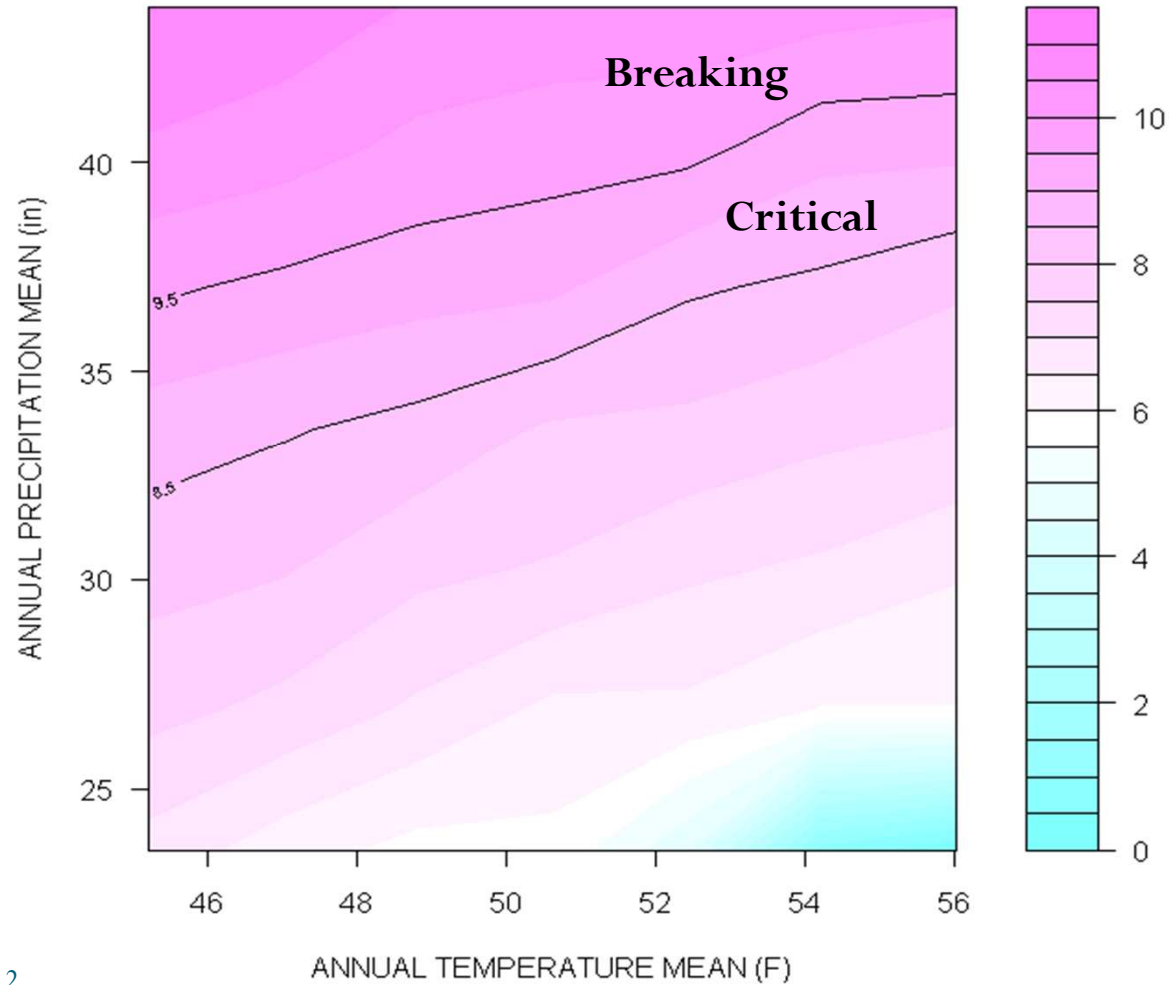

HydroPredict, Vienna, September 2012

Special Session 3: Choosing Models for Resilient Water Resources Management

Water Partnership Program (WPP)/TWIWA- The World Bank

# Stress Test: Expected Annual Damages

**EXPECTED ANNUAL FLOOD DAMAGES  
(\$, MILLIONS)**

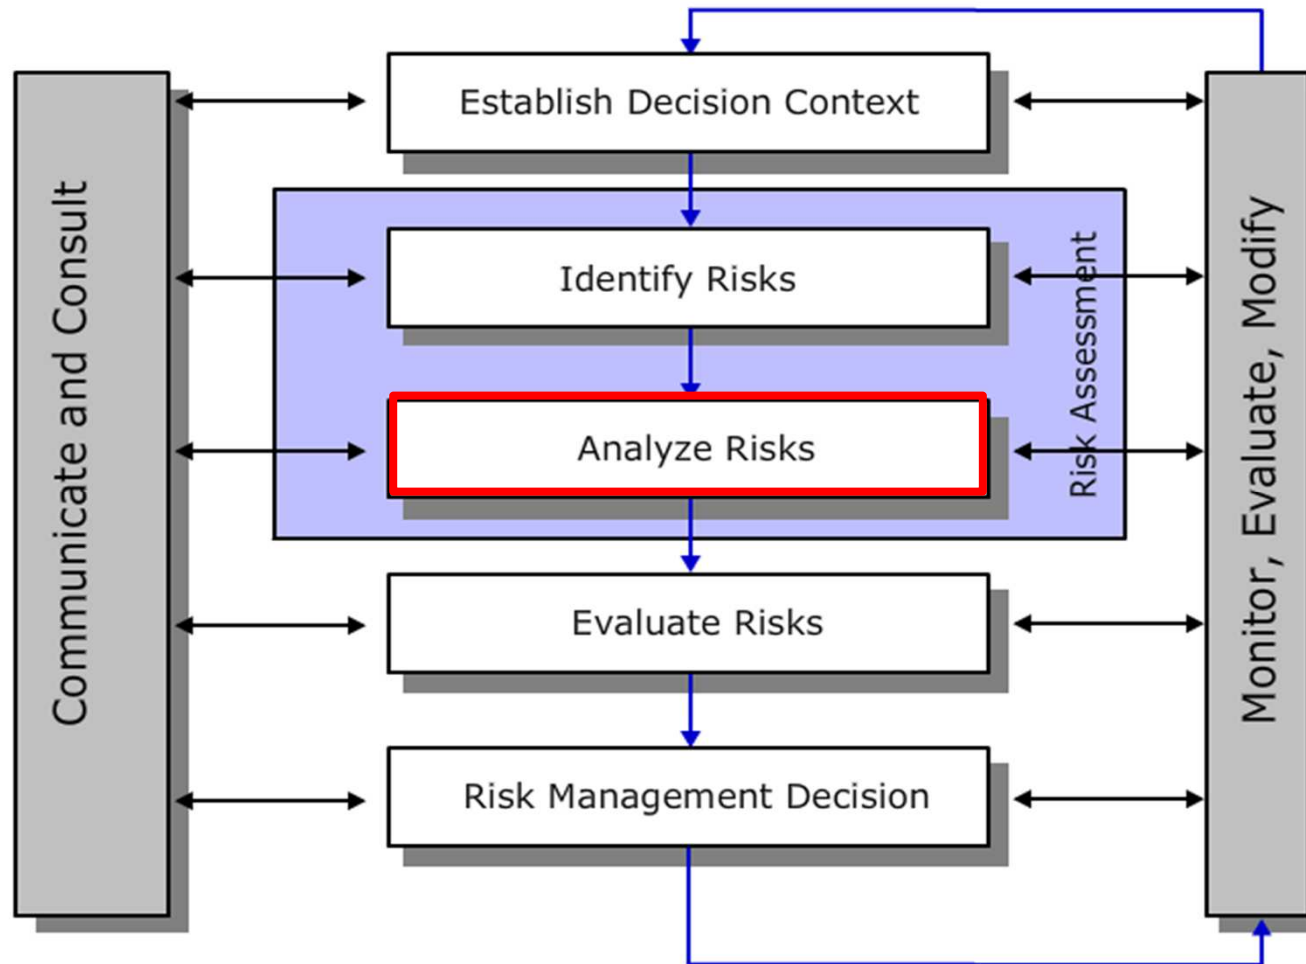

HydroPredict, Vienna, September 2012

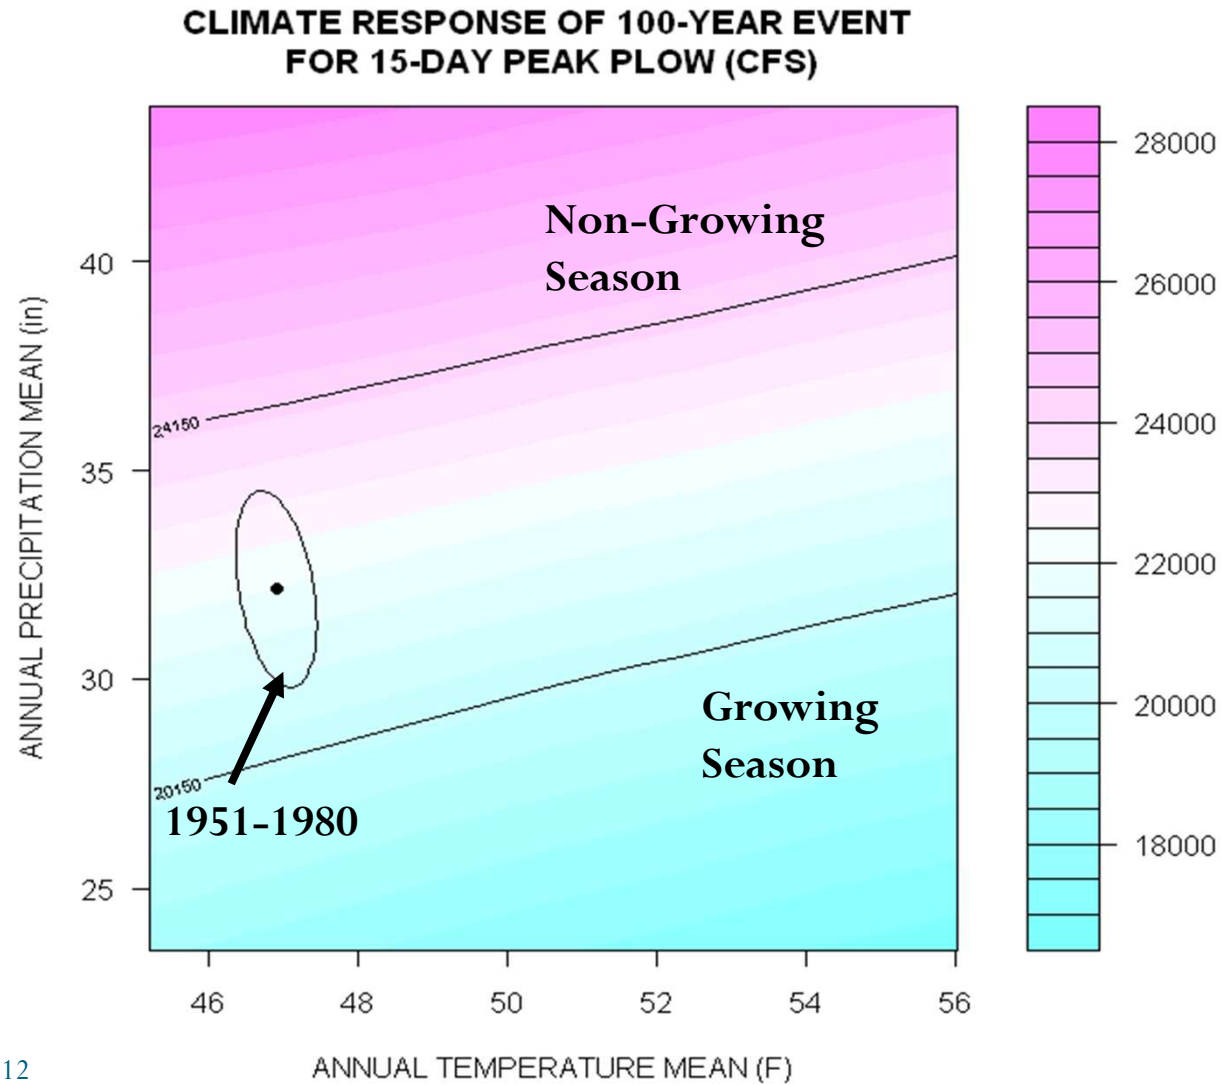

Special Session 3: Choosing Models for Resilient Water Resources Management

Water Partnership Program (WPP)/TWIWA- The World Bank

# Risk Informed Decision Making Framework

# Risk Assessment Part II: Analyze Risks

HydroPredict, Vienna, September 2012

Special Session 3: Choosing Models for Resilient Water Resources Management

Water Partnership Program (WPP)/TWIWA- The World Bank

# Risk Assessment Part II: Analyze Risks

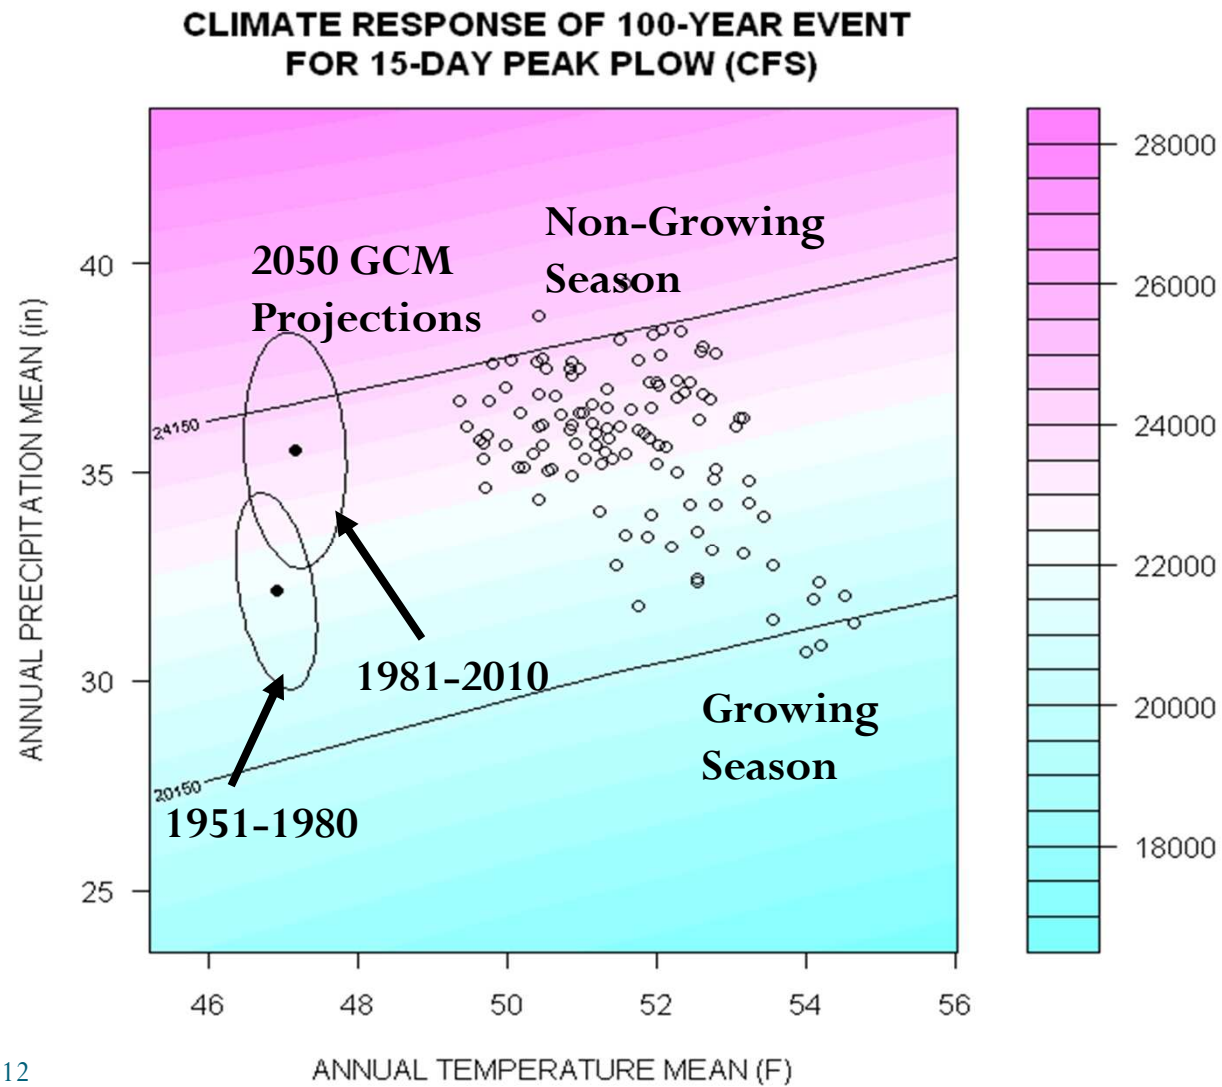

HydroPredict, Vienna, September 2012

Special Session 3: Choosing Models for Resilient Water Resources Management

Water Partnership Program (WPP)/TWIWA- The World Bank

# Risk Assessment Part II: Analyze Risks

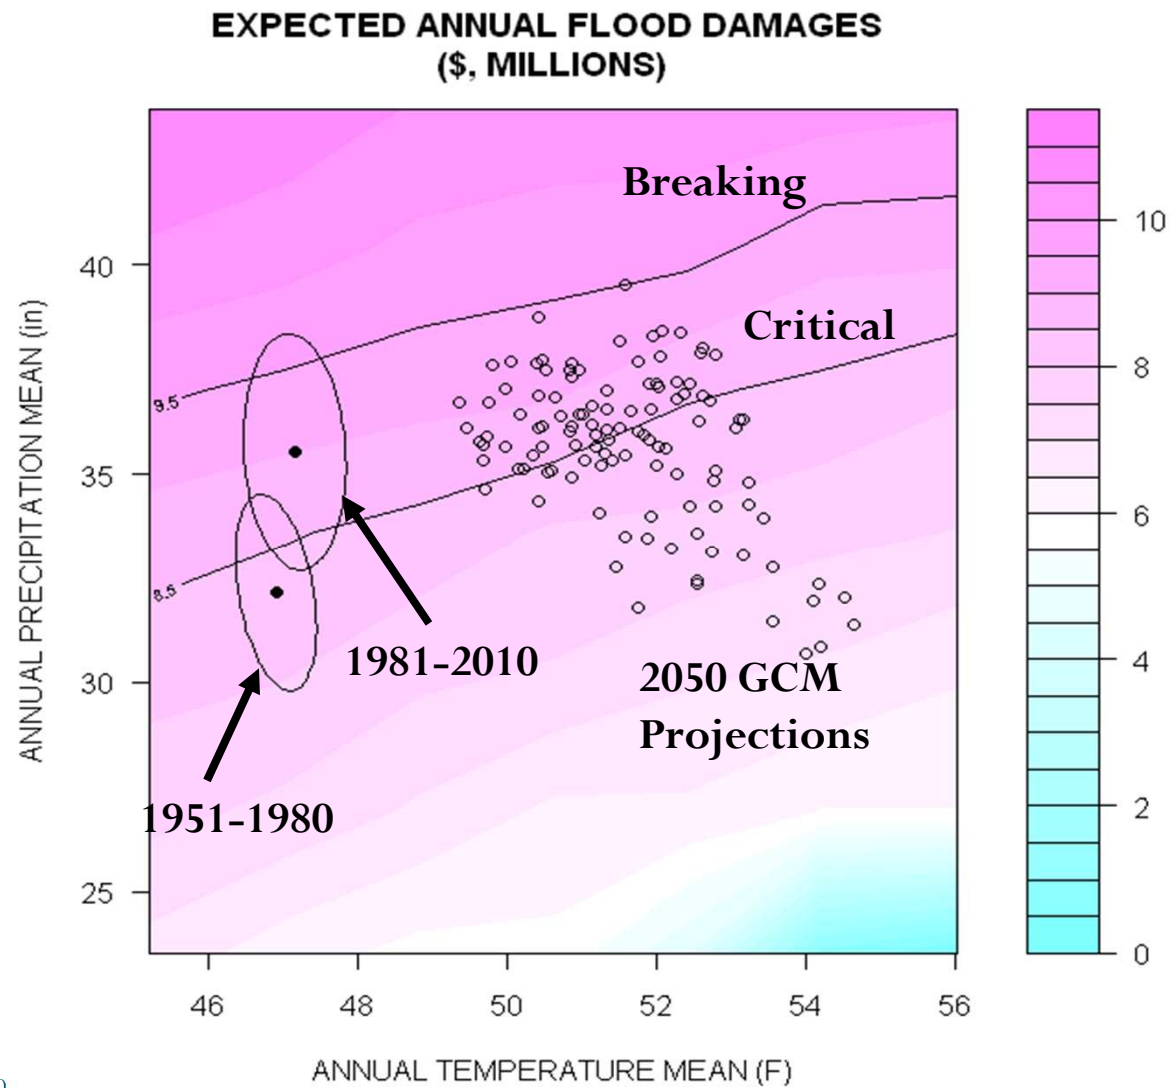

HydroPredict, Vienna, September 2012

Special Session 3: Choosing Models for Resilient Water Resources Management

Water Partnership Program (WPP)/TWIWA- The World Bank

# Risk Assessment Part II: Analyze Risks

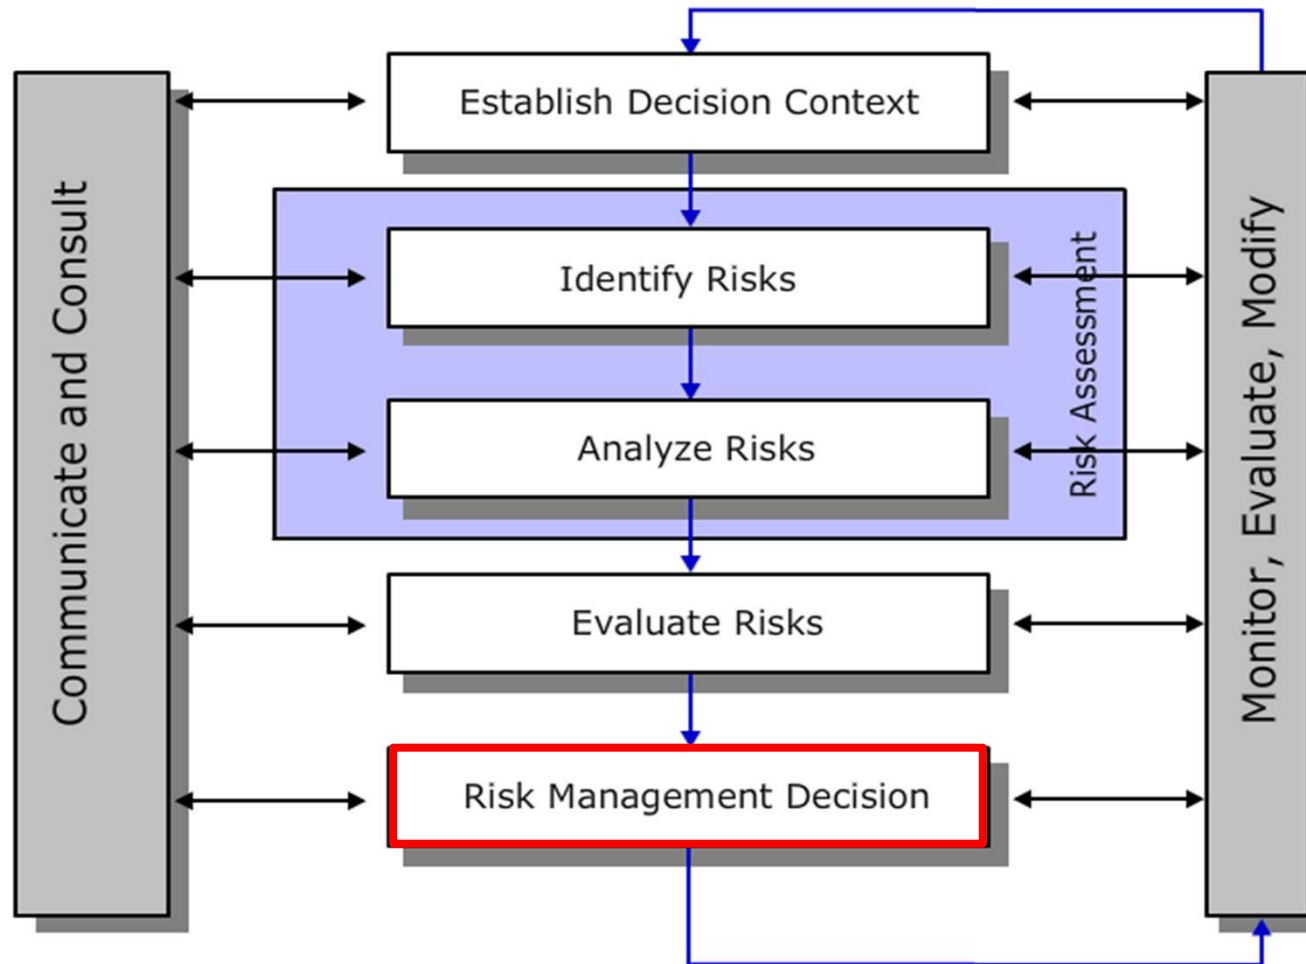

HydroPredict, Vienna, September 20

Special Session 3: Choosing Models for Resilient Water Resources Management

Water Partnership Program (WPP)/TWIWA- The World Bank

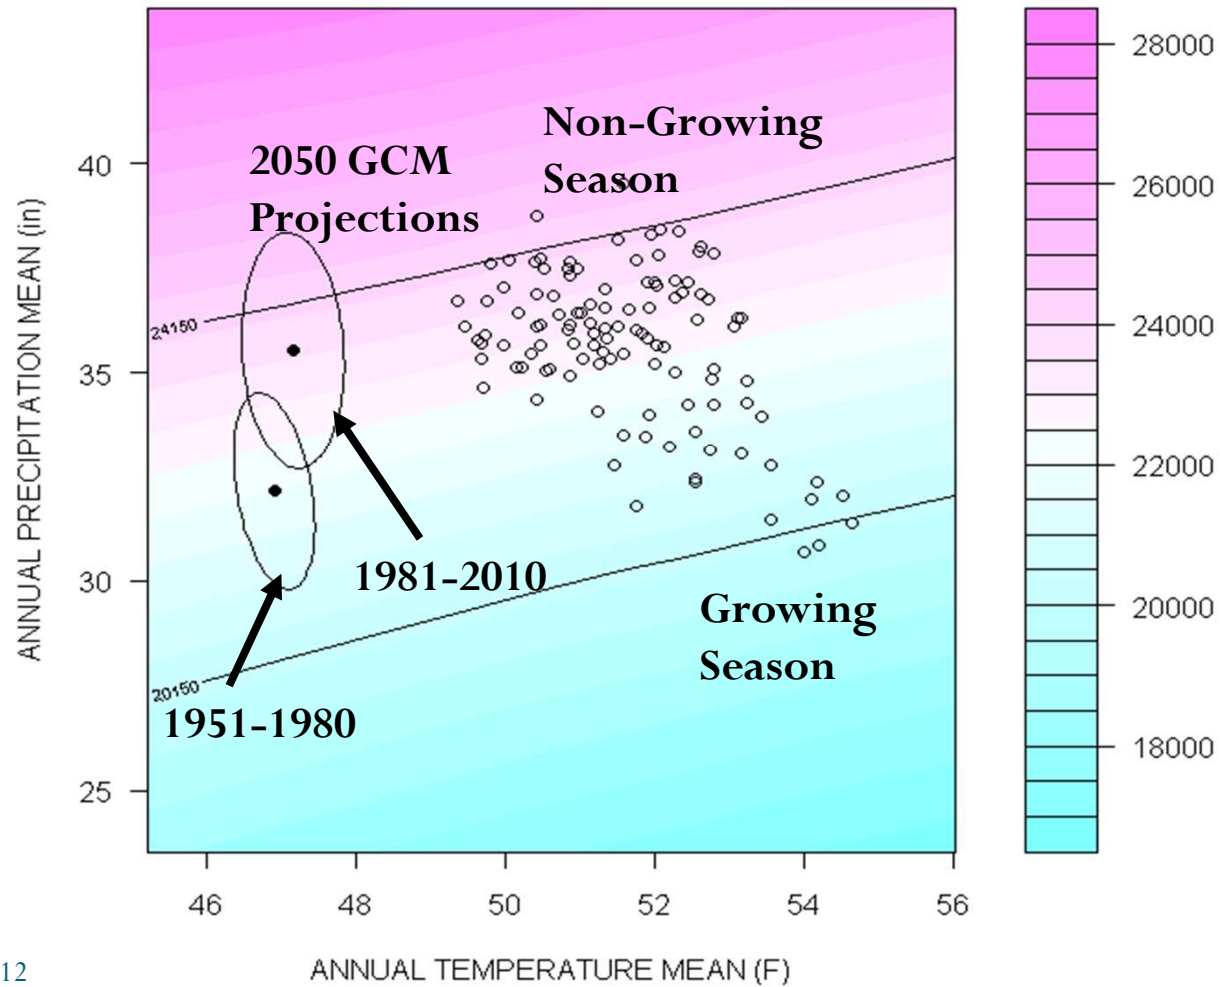

# Risk Informed Decision Making Framework

# Risk Assessment Part II: Analyze Risks

**CLIMATE RESPONSE OF 100-YEAR EVENT  
FOR 15-DAY PEAK FLOW (CFS)**

# Decision Matrix

		Critical Zone		
		Low	Med	High
Confidence	High		Observed data 1951-1981	
		TRADITIONAL COST-BENEFIT ANALYSIS		
	Med		Observed data 1982-2010	
		ADAPTIVE MANAGEMENT and ROBUST DECISION MAKING W/ HIGH UNCERTAINTY		
Low		GCM Projections		
	ADAPTIVE MANAGEMENT and ROBUST DECISION MAKING W/ HIGH UNCERTAINTY			

# Decision Making Methods

- Low regrets alternatives that do well in different climates
- Incremental cost analysis and cost effectiveness of increased climate robustness
- Collaborative decision making and shared risk tolerance of future uncertainty

# Future work

- **Methodology needs**
  - Different critical metrics
  - Additional climate variables
  - Seasonal models
  - Economic decision models
- **Collaborative**
  - Further collaboration w/ AGWA
  - Pilot studies
    - Water Supply pilot in Lake Oologah
    - Additional international pilot studies
      - Nicaragua
      - Bolivia

# Thank you!

“Downscaling helps people do the wrong things more precisely.”

## Questions?

# Weather Generator: Modeling Approach

1. Data-Driven, Semi-Parametric Weather Generator
  - Deals with spatial covariance problem
2. Wavelet Auto-Regressive Modeling (WARM)
  - Deals with long-term persistence problem
3. Quantile Mapping Adjustments
  - Allows us to model many types of climate changes

# Comparison of Proposed Alternatives

Metric	Alternative 1		Alternative 2	
	Historic Data	GCM Projections	Historic Data	GCM Projections
EAD (\$)				
Net Benefits (\$)				
Robustness				
Climate Informed Robustness				

## Additional Considerations

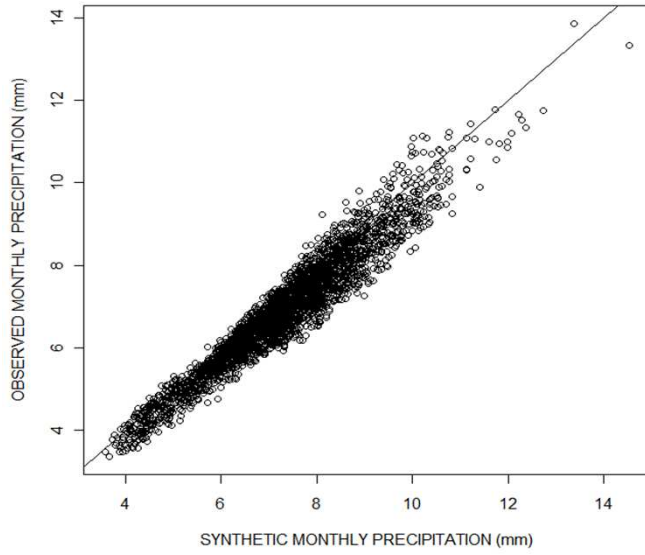

- Is this a one-time decision or a repeated decision?
- Are the risks under historic climate or climate change?
- Are climate projections credible?
  - Are they in agreement?
  - Do they suggest expected trends for region?

# Evaluate Risks: Adaptive Management Approach

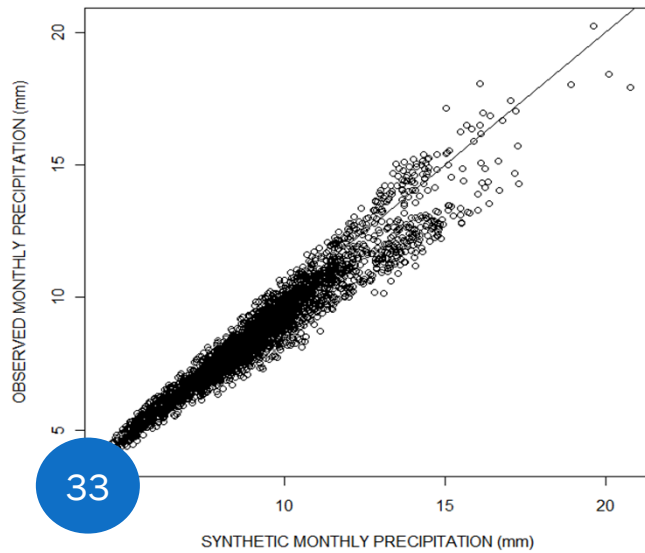

- Identify climate states each alternative is resilient to
- Build sequences of alternatives (i.e., Path A vs. Path B) to cover all ‘plausible’ climate states
- Explore the cost of choosing Path A when climate shifts towards Path B
- Assess the sensitivity of path selection to probabilities assigned to each climate state
