

# Comparison of statistical downscaling procedures for climate change impact assessment of water resources

Henrik Madsen, Maria Sunyer, Keiko Yamagata  
DHI, Denmark

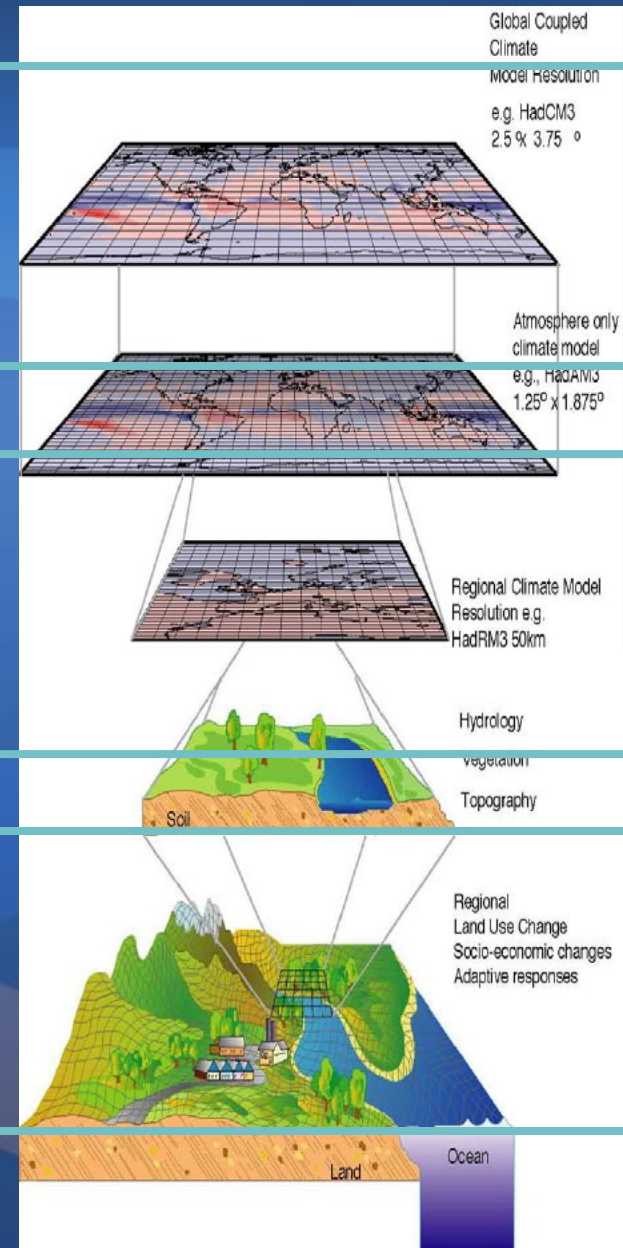

HydroPredict 2010, 20-23 September 2010, Prague, Czech Republic

## Global climate model projections

## Downscaling

- Dynamical
- Statistical

## Local-scale impact assessment

## Regional climate model (RCM)

- Driven by GCM boundary conditions
- Higher resolution (10-50 km)
- Resolves sub-GCM grid scale forcings in a physically-based way

➤ **Further statistical downscaling needed**

- Define relationship between large-scale model (GCM or RCM) and local climate
- Methods based on Change Factor Methodology:
  - Mean correction
  - Mean and variance correction
  - Weather Generators

Change factors {  
- Mean  
- Variance  
- Proportion of dry days  
- ...

- **Mean correction (delta change)**

$$P_{fut} = a \cdot P_{obs}$$

Model fitting:  
-Mean

- **Mean and variance correction**

$$P_{fut} = a \cdot P_{obs}^b$$

Model fitting:  
-Mean  
-Variance

- **Weather generators**

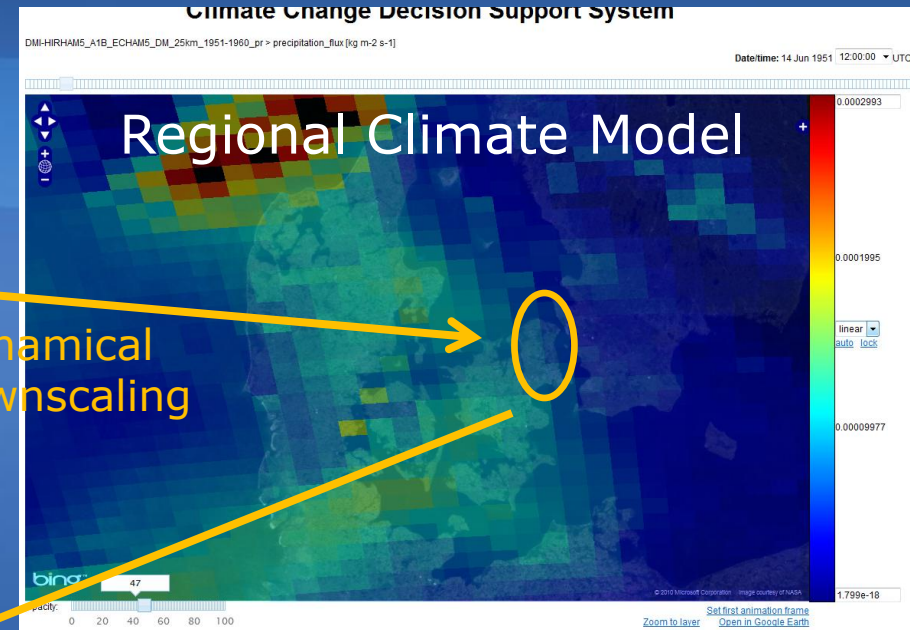

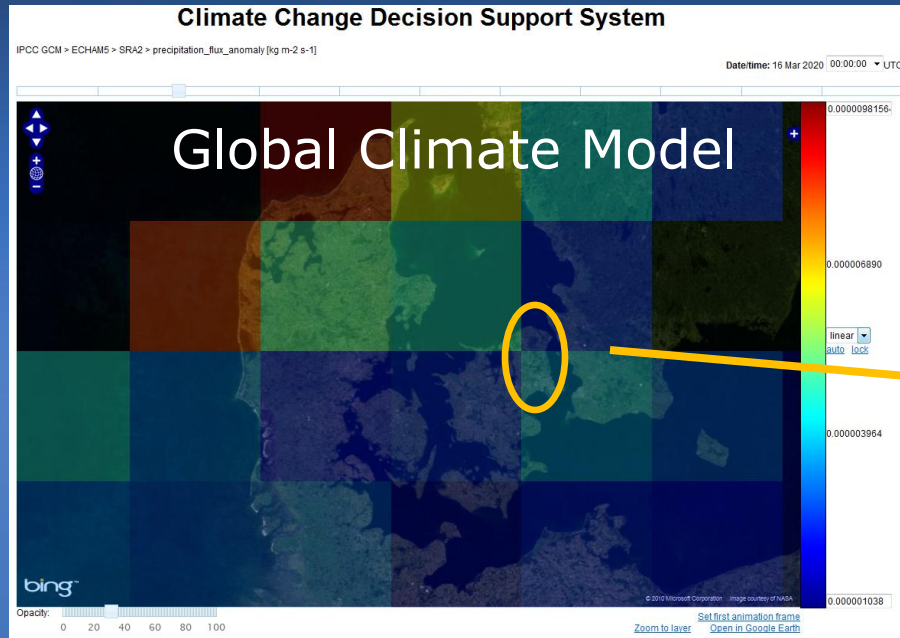

Model fitting:  
-Mean  
-Variance  
-Skewness  
-Dry-day prob.  
-Autocorrelation  
-Transition prob.

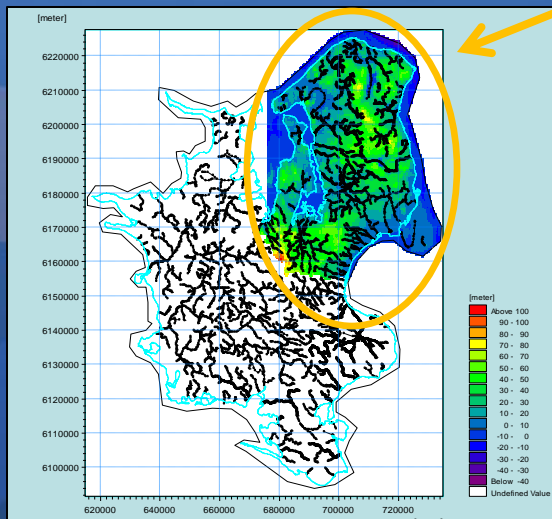

- **Neyman-Scott**
- **Rectangular Pulses**
- **Markov Chain**
- **LARS WG**

# Case study – North Sealand

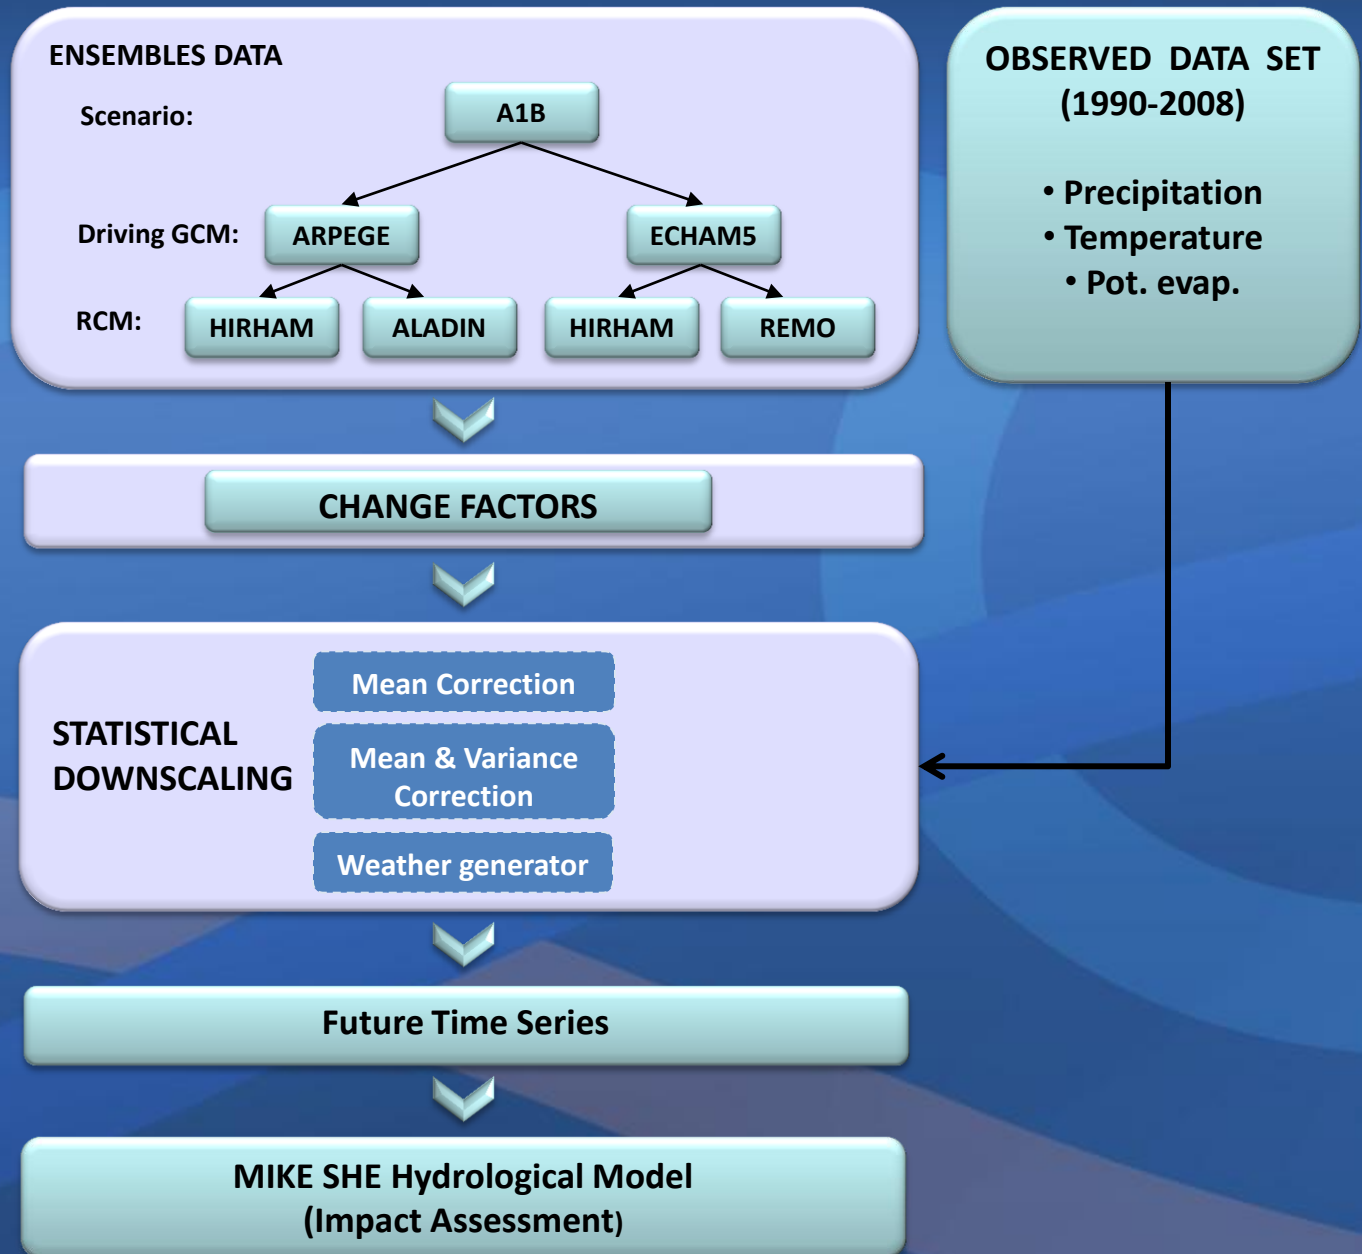

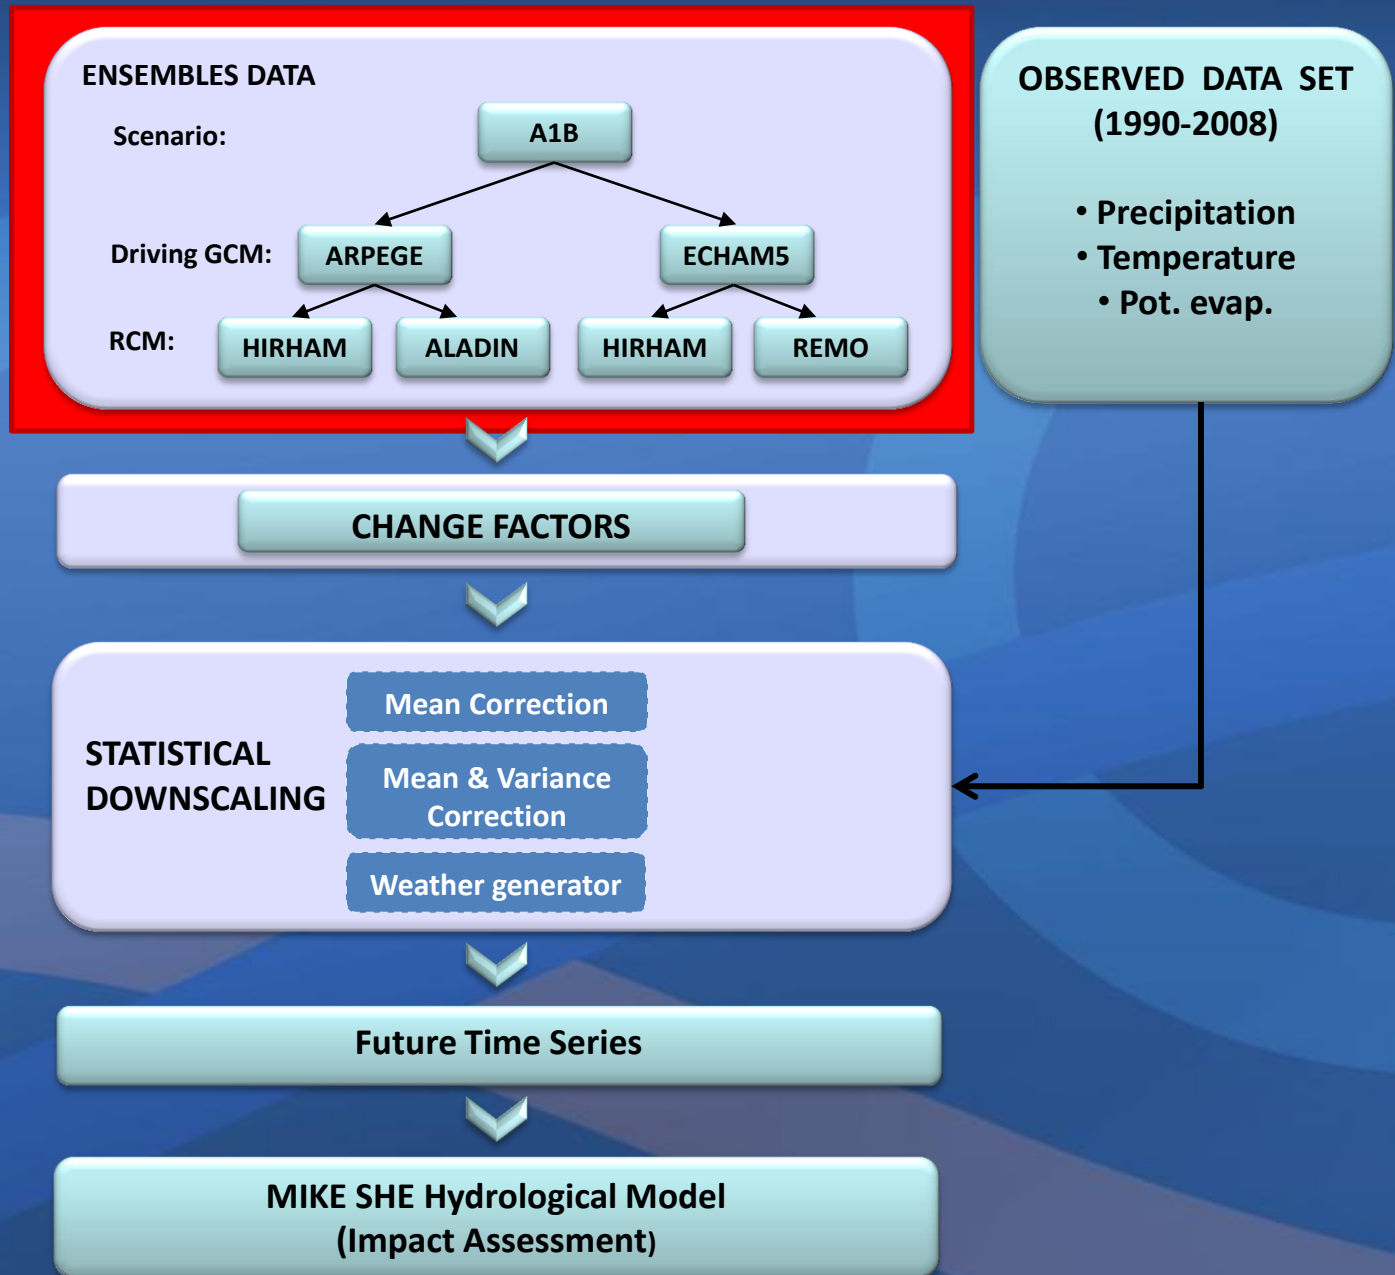

Dynamical  
downscaling

Statistical  
downscaling

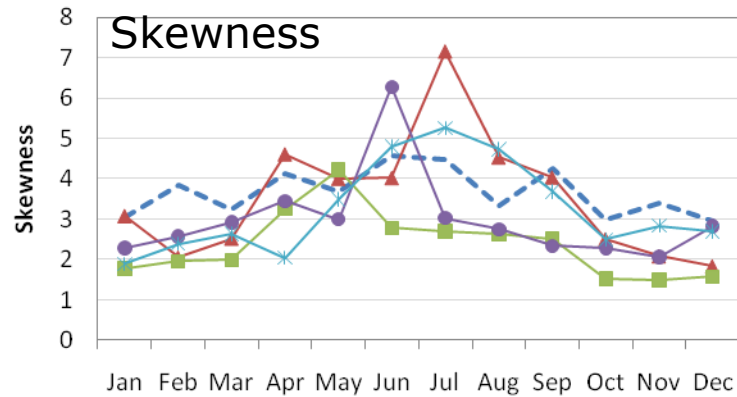

**Asses climate change impacts  
on hydrology  
North Sealand (3000 km<sup>2</sup>)**

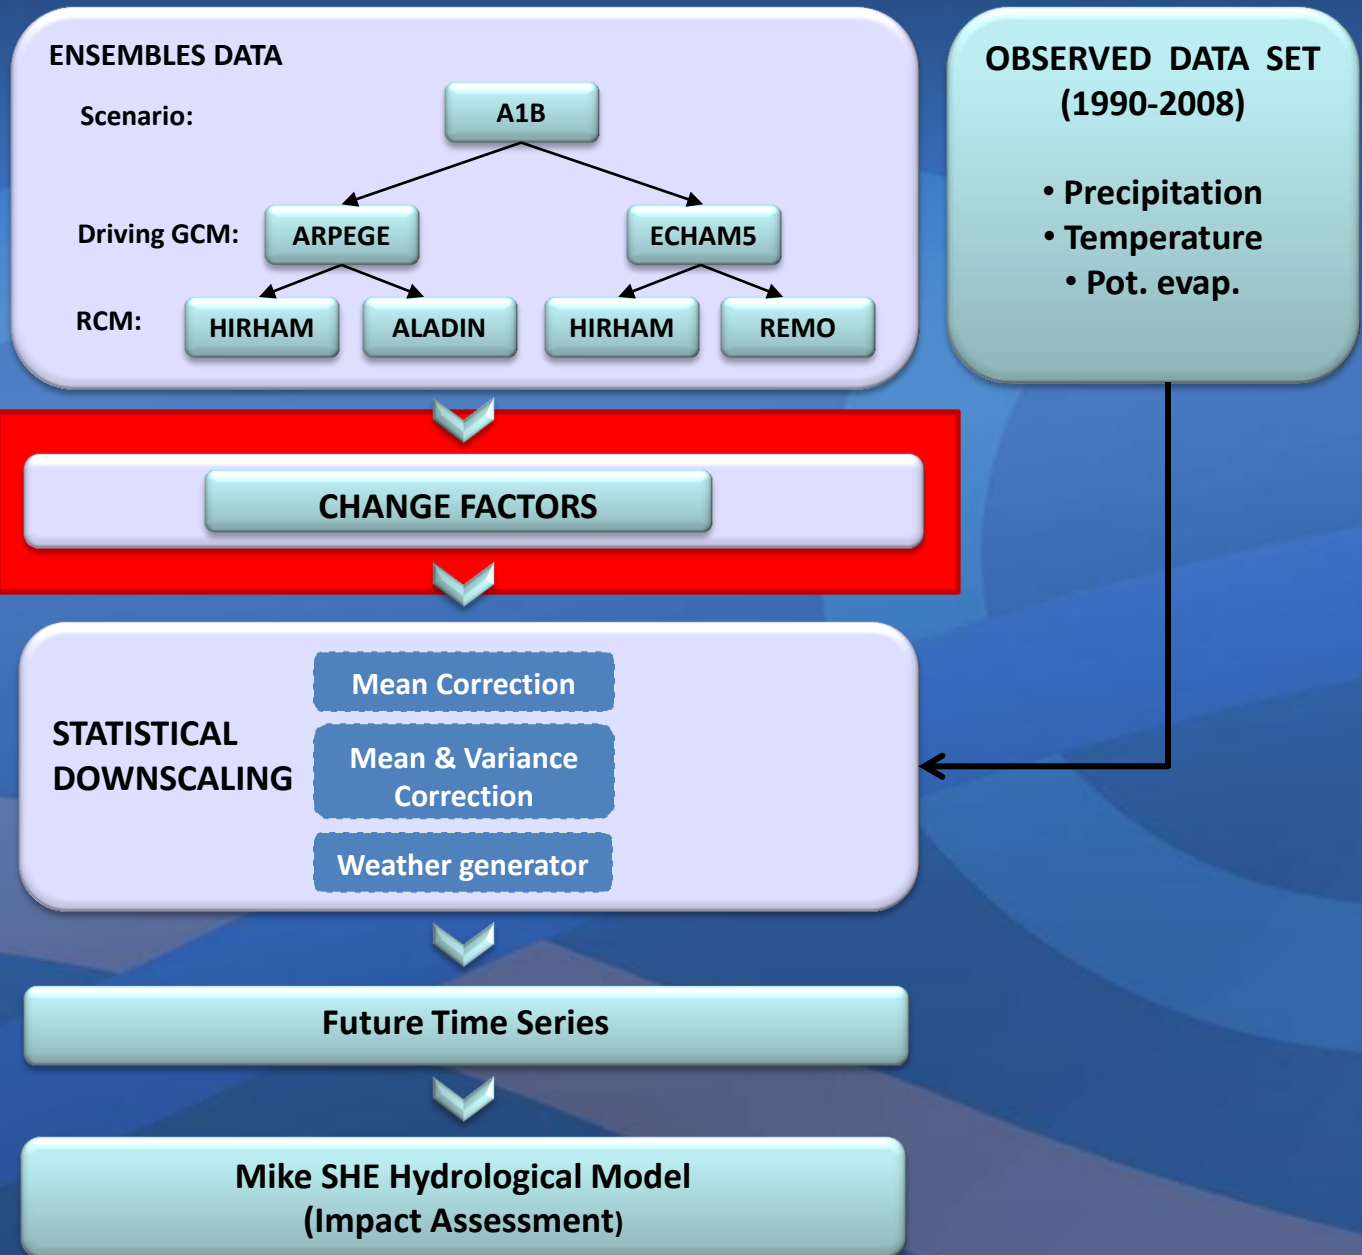

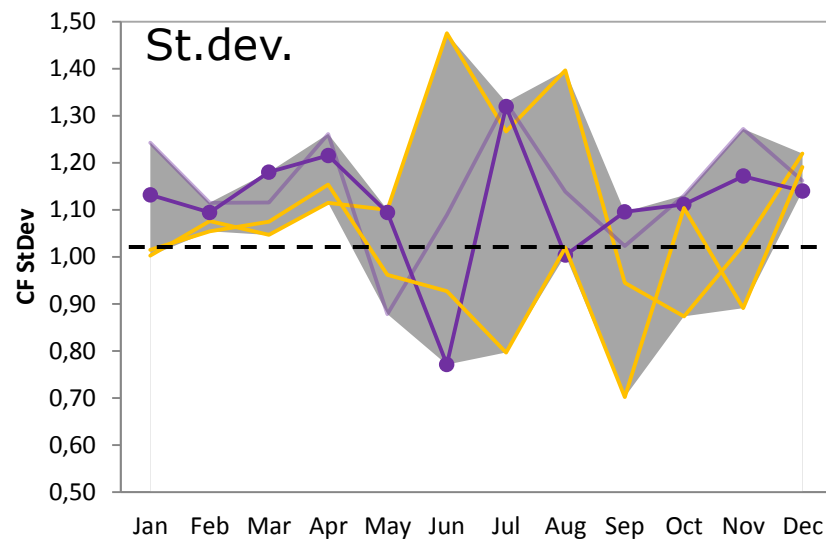

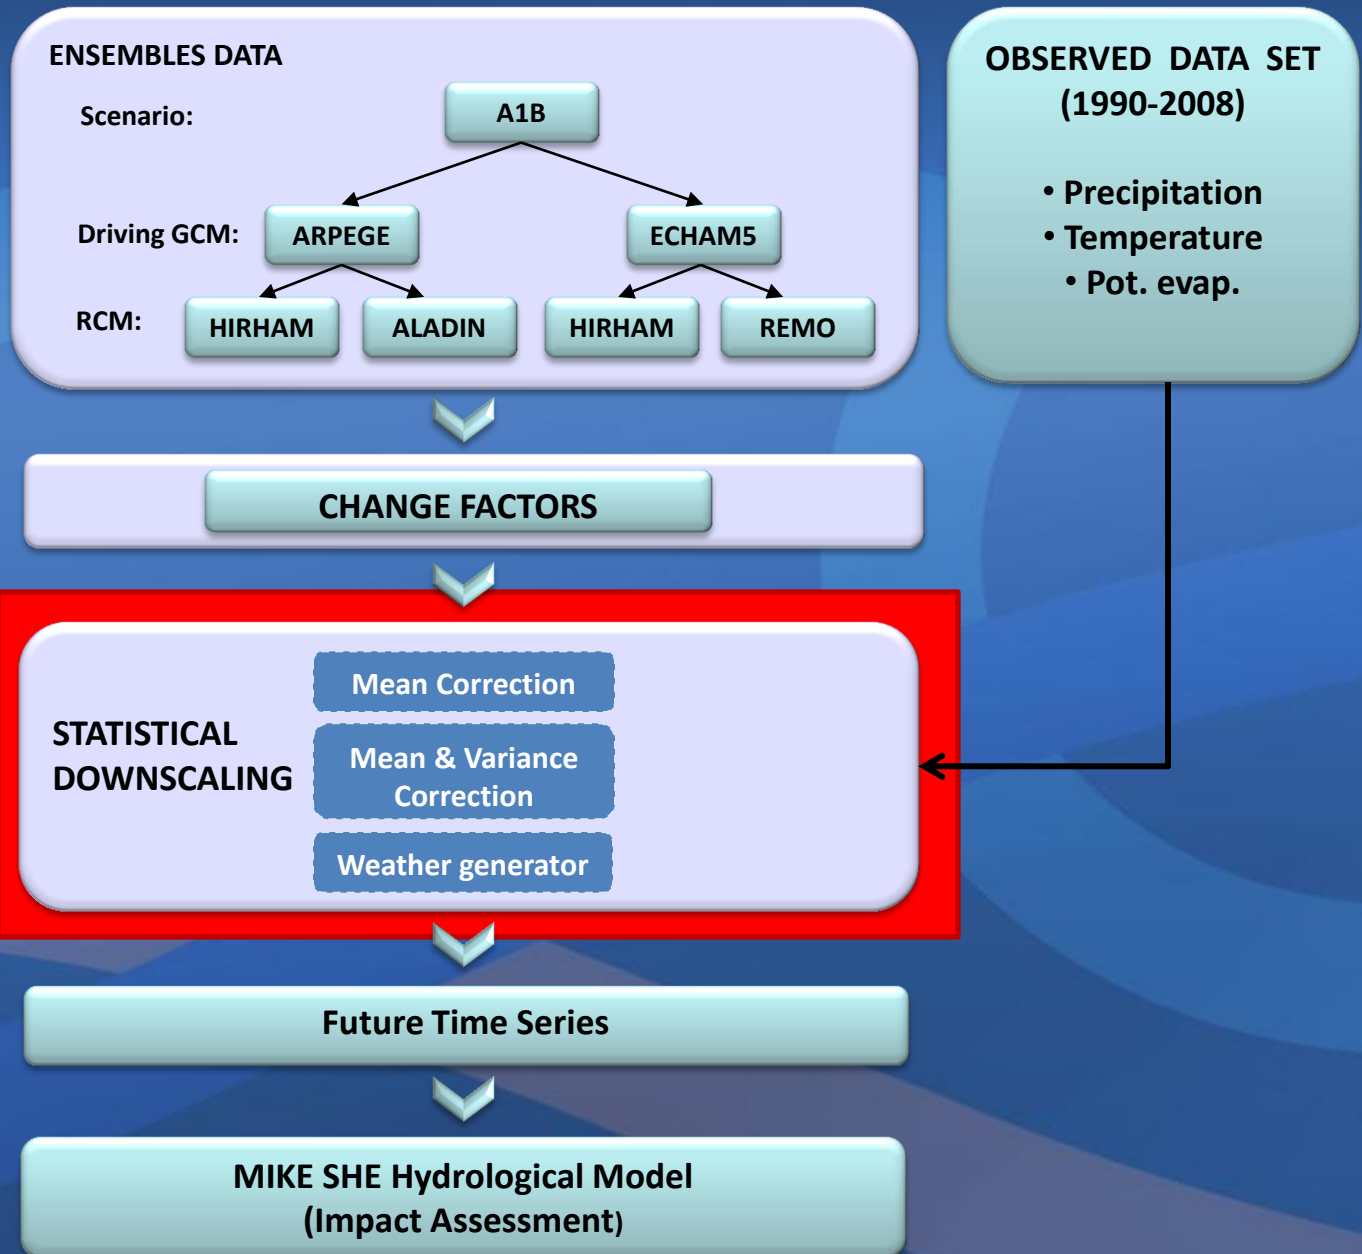

# RCM compared to observations - precipitation

# Change factors precipitation (2070-2100)

# Statistical downscaling (2070-2100)

Annual Maximum  
Discharge

Annual Minimum  
Discharge

- Statistical downscaling required for climate change impact assessments
  - Scaling of GCM/RCM to the appropriate spatial and temporal scales
  - Statistical adjustments of GCM/RCM
- Choice of statistical downscaling procedure depends on application
  - Water balance studies -> Mean correction
  - Extreme event analysis -> Stochastic weather generators
- Assessment of uncertainties important
  - Scenario uncertainty
  - GCM/RCM uncertainty
  - Statistical downscaling uncertainty
  - Impact model uncertainty
- Probabilistic projections needed for climate change impact assessments and decisions on adaptation.

# Thank you for your attention
